Measurement of Boson self couplings at LEP

and
search for anomalies

Martin Weber

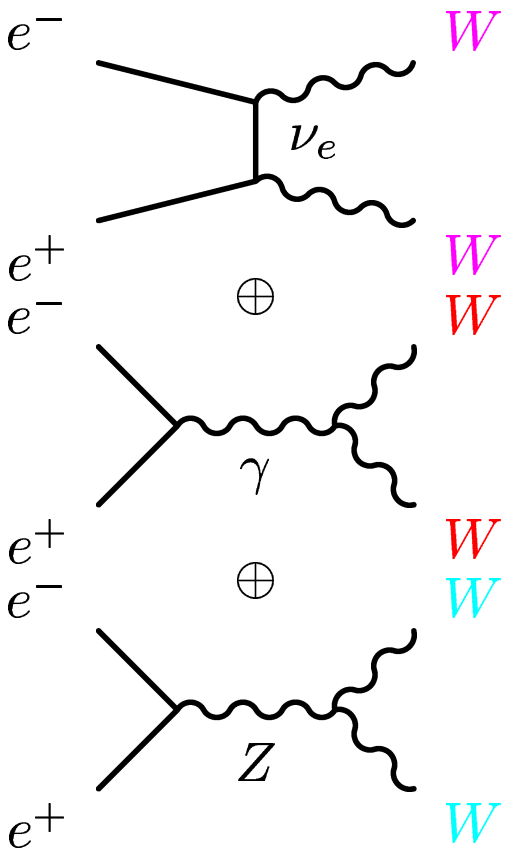
III. Physikalisches Institut, RWTH Aachen and L3 Collaboration, CERN

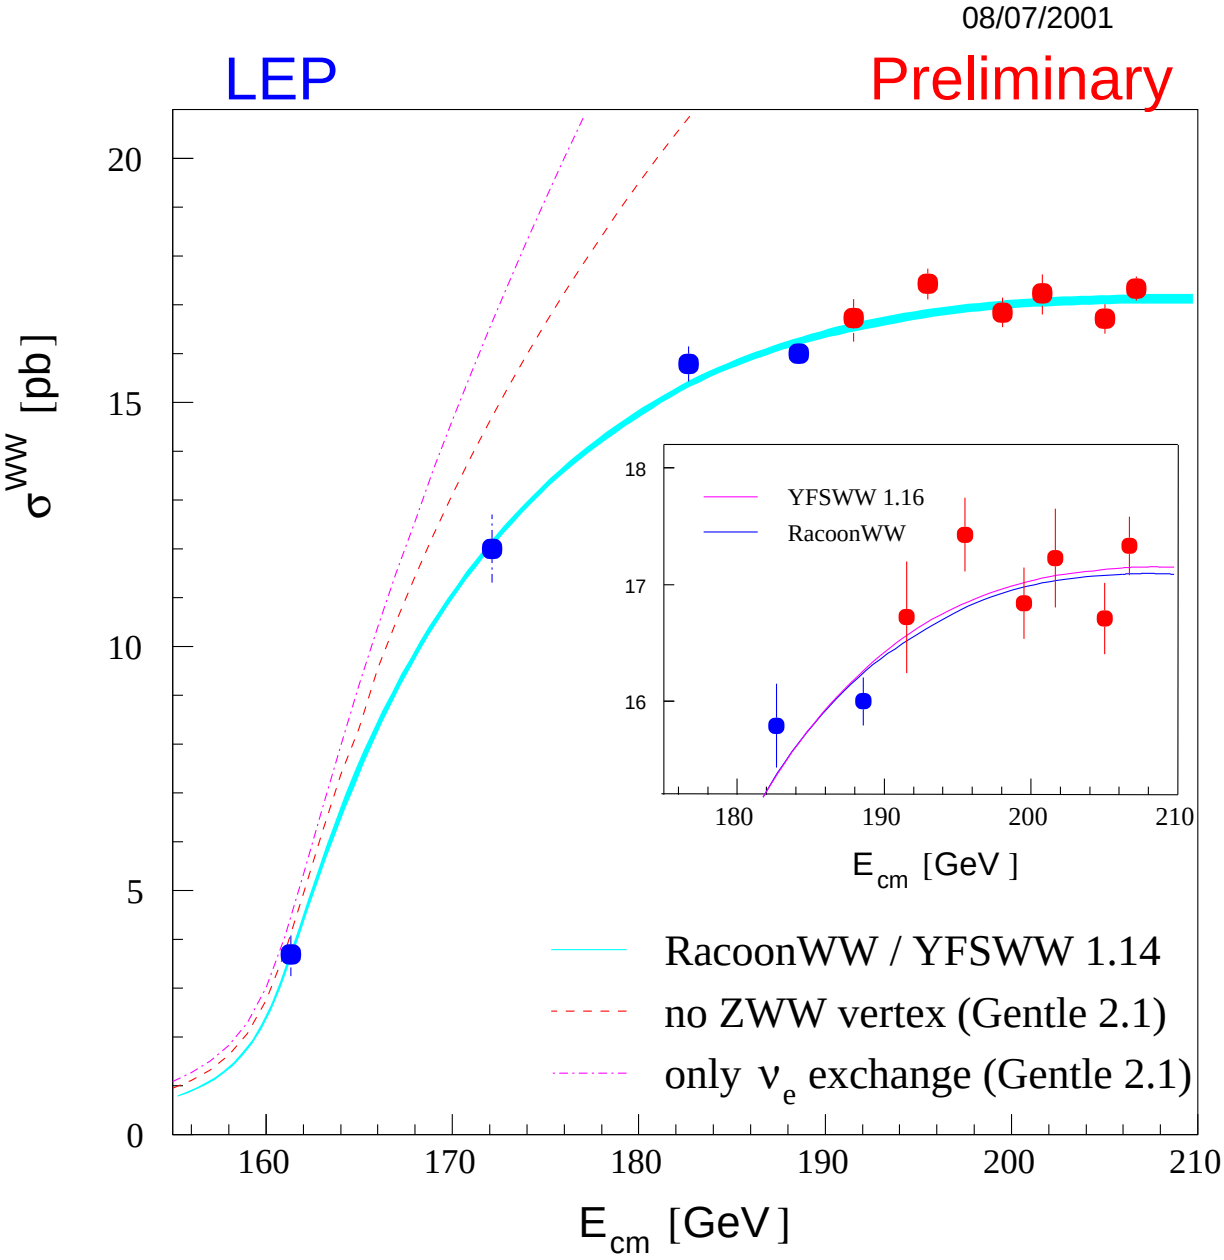
On behalf of the LEP experiments

Original title: “Four Fermion Interactions and Anomalous Couplings”

XXXVIIth Rencontres de Moriond

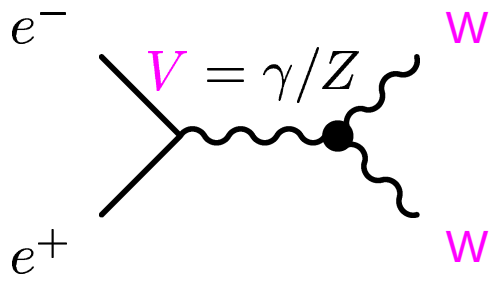
W^+W^- cross section





The non-Abelian structure of the Standard Model is needed to describe the data!

Couplings of the W to other bosons



Vertex described by Lagrangian (only CP conserving terms of lowest dimension (6 couplings):

$$\mathcal{L}^{WWV}/g_{WWV} = g_1^V \left(W_{\mu\nu}^\dagger W^\mu V^\nu - W_\mu^\dagger V_\nu W^{\mu\nu}\right) + \kappa_V W_\mu^\dagger W_\nu V^{\mu\nu} + \frac{\lambda_V}{m_W^2} W_{\mu\nu}^\dagger W_\nu^\mu V^{\rho\mu}$$

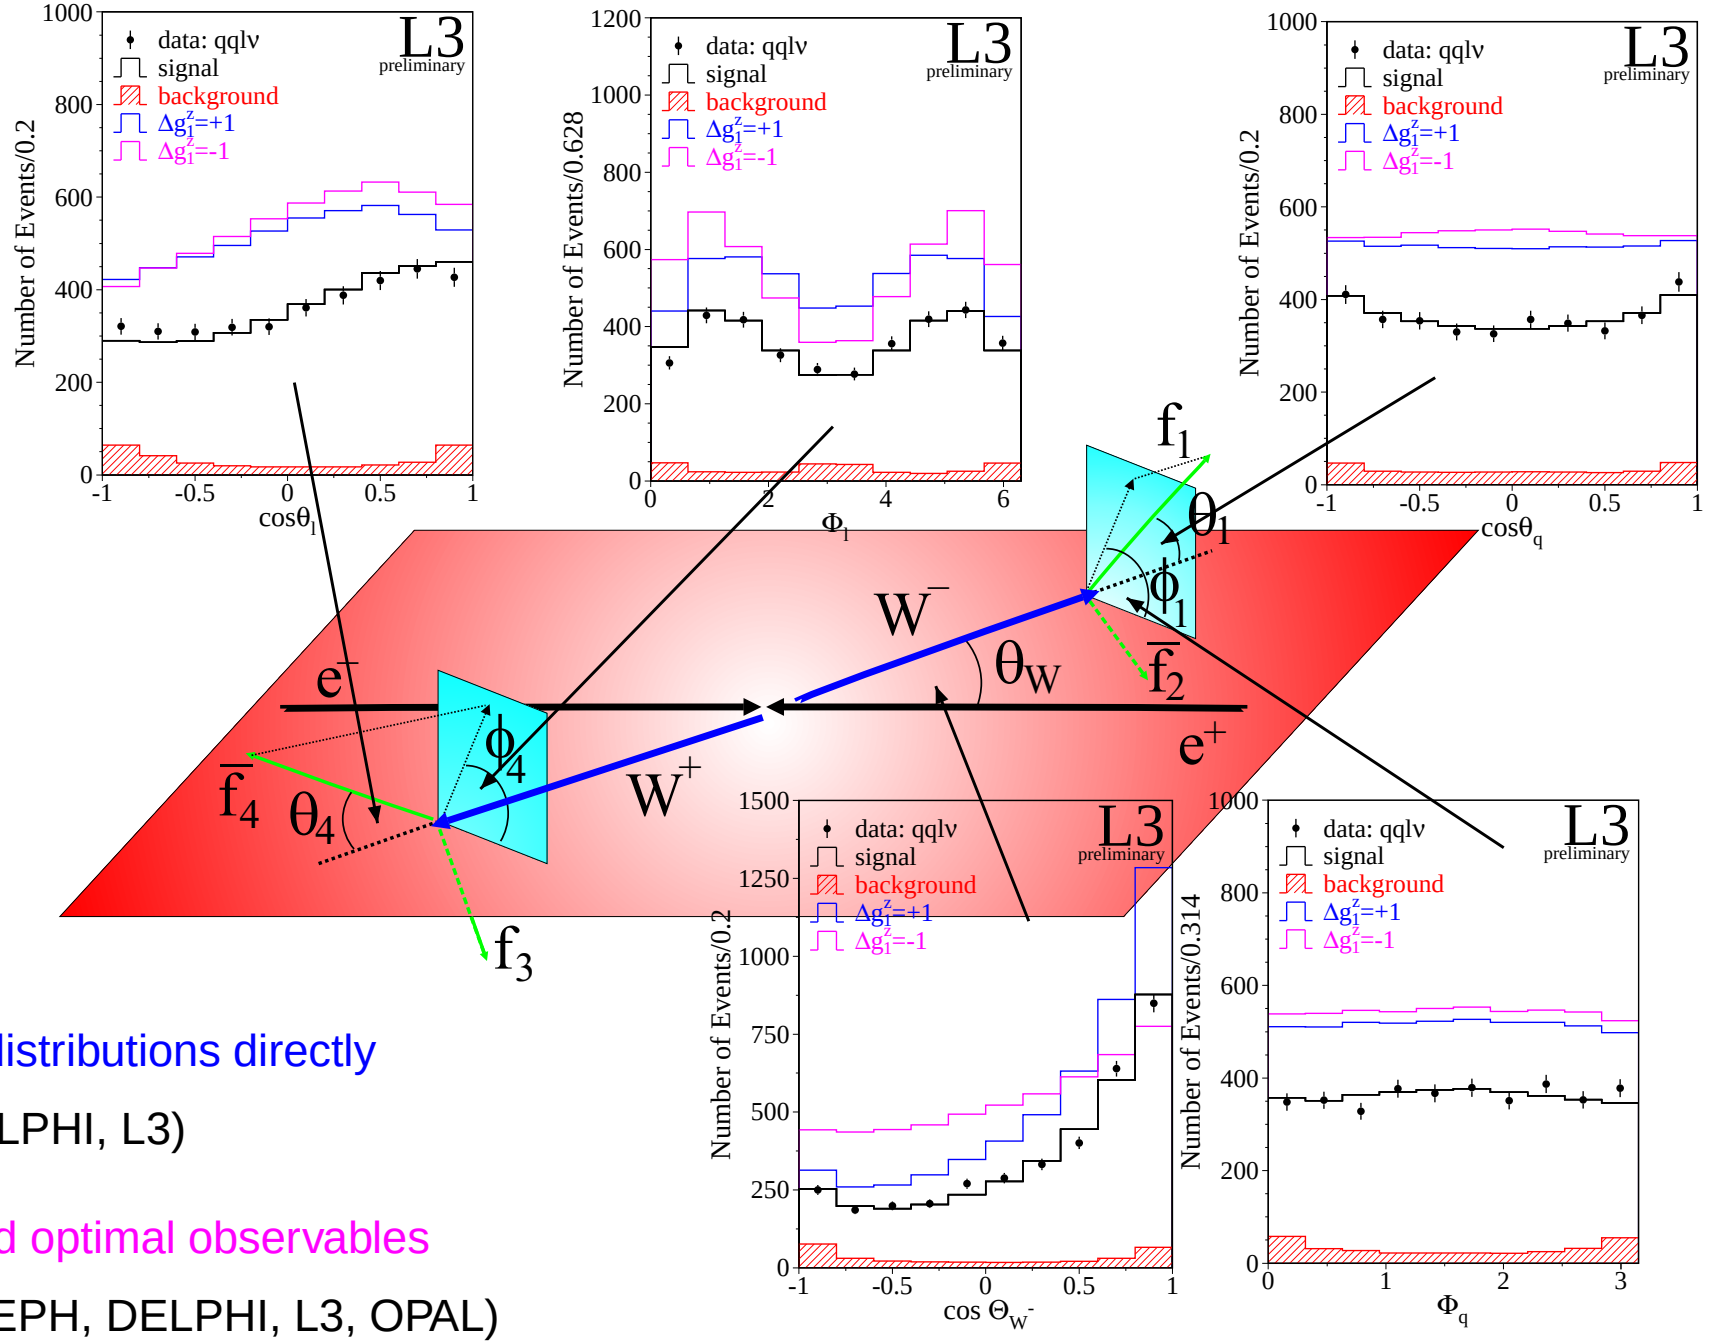
Require U(1)$_{em}$ gauge invariance and SU(2) $\times$ U(1) symmetry (fix 3 couplings):

$$\begin{aligned} g_1^\gamma &= 1 \qquad (q_W = \pm 1) \\ \kappa_Z &= g_1^Z - (\kappa_\gamma - 1)\tan^2\theta_W \\ \lambda_Z &= \lambda_\gamma \end{aligned}$$

Remaining 3 couplings are fitted:

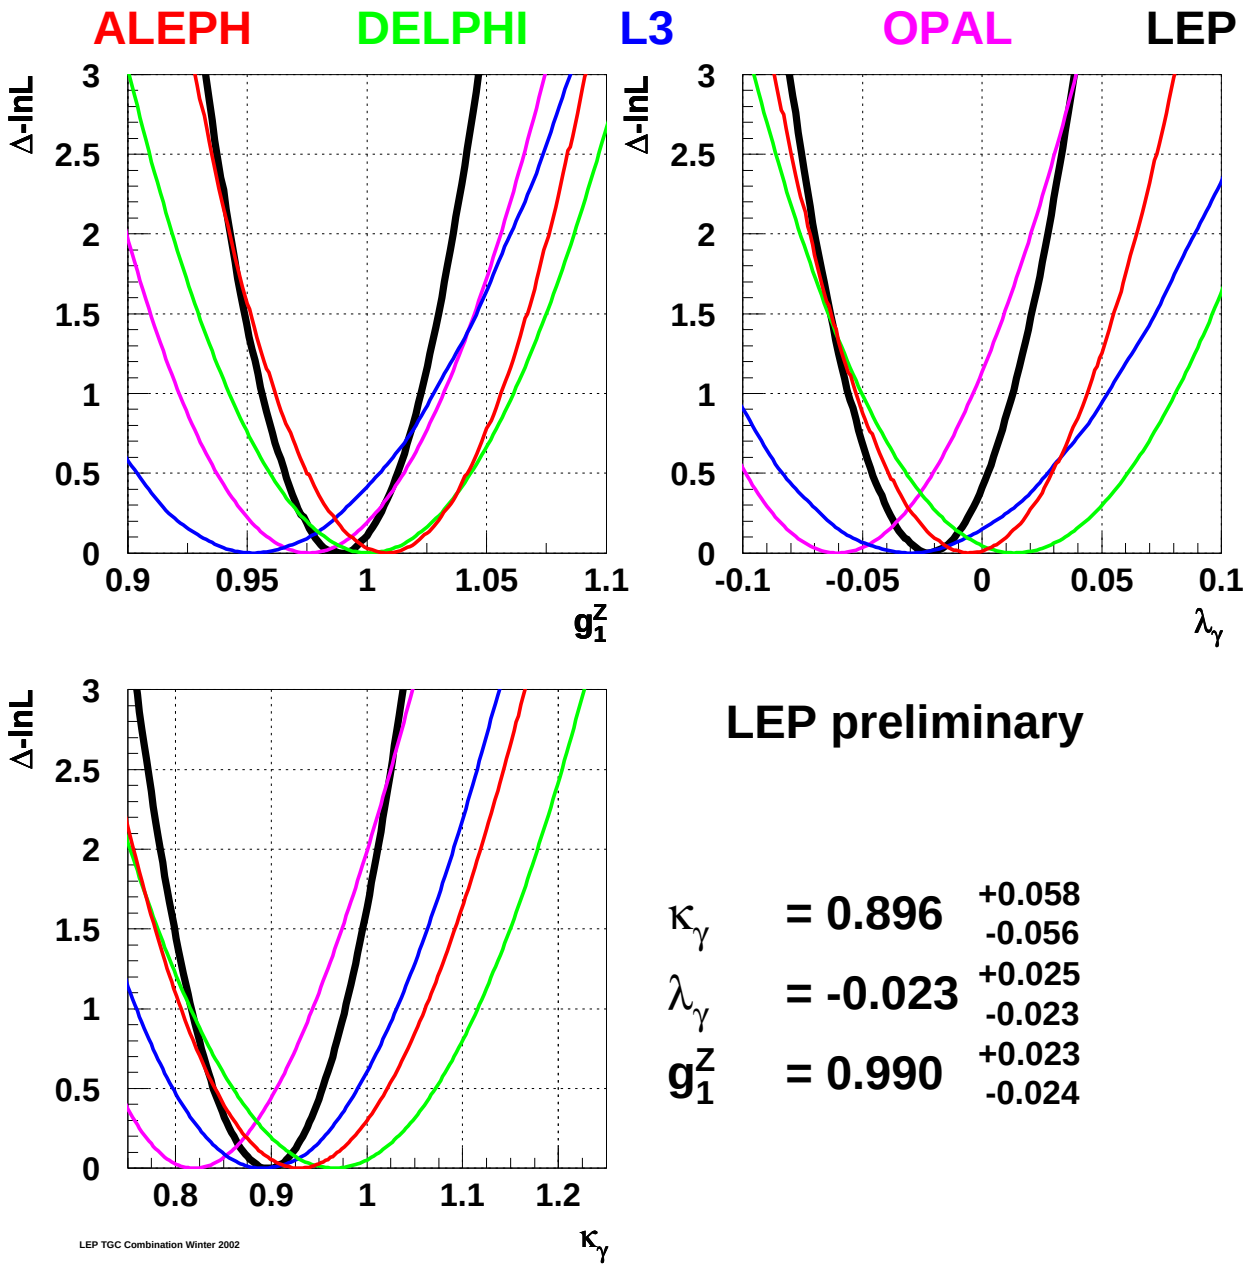
$$\begin{array}{llcll} g_1^Z & (\text{SM}:1) & & \Delta g_1^Z = g_1^Z - 1 & (\text{SM}:0) \\ \kappa_\gamma & (\text{SM}:1) & \rightarrow & \Delta\kappa_\gamma = \kappa_\gamma - 1 & (\text{SM}:0) \\ \lambda_\gamma & (\text{SM}:0) & & \lambda_\gamma & (\text{SM}:0) \end{array}$$

Couplings of the W to other bosons: measurement method



- Fit distributions directly
  (DELPHI, L3)
- Build optimal observables
  (ALEPH, DELPHI, L3, OPAL)

Couplings of the W to other bosons: Single parameter fit



LEP preliminary

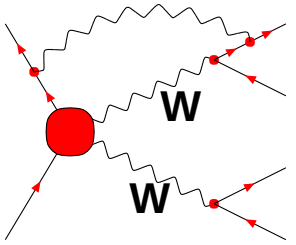
$\kappa_\gamma = 0.896\ ^{+0.058}_{-0.056}$

$\lambda_\gamma = -0.023\ ^{+0.025}_{-0.023}$

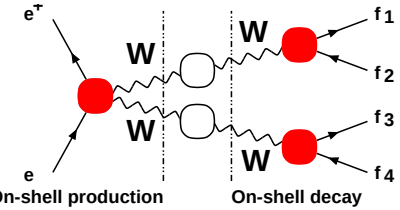
$g_1^Z = 0.990\ ^{+0.023}_{-0.024}$

Theoretical improvements:

$\mathcal{O}(\alpha)$ corrections



DPA



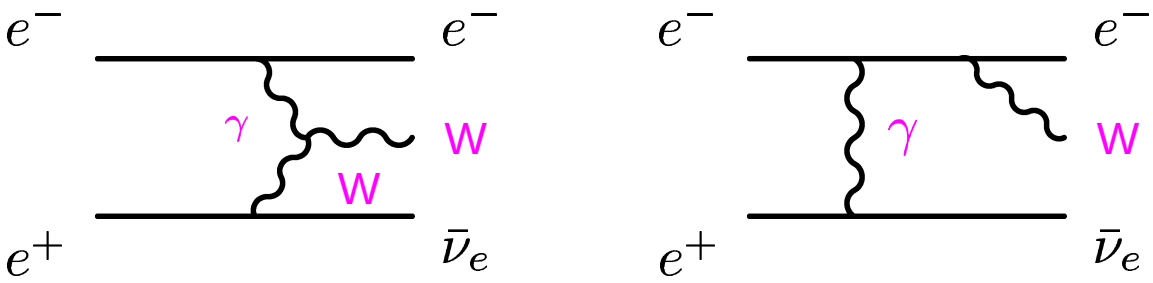
- Not all channels are included

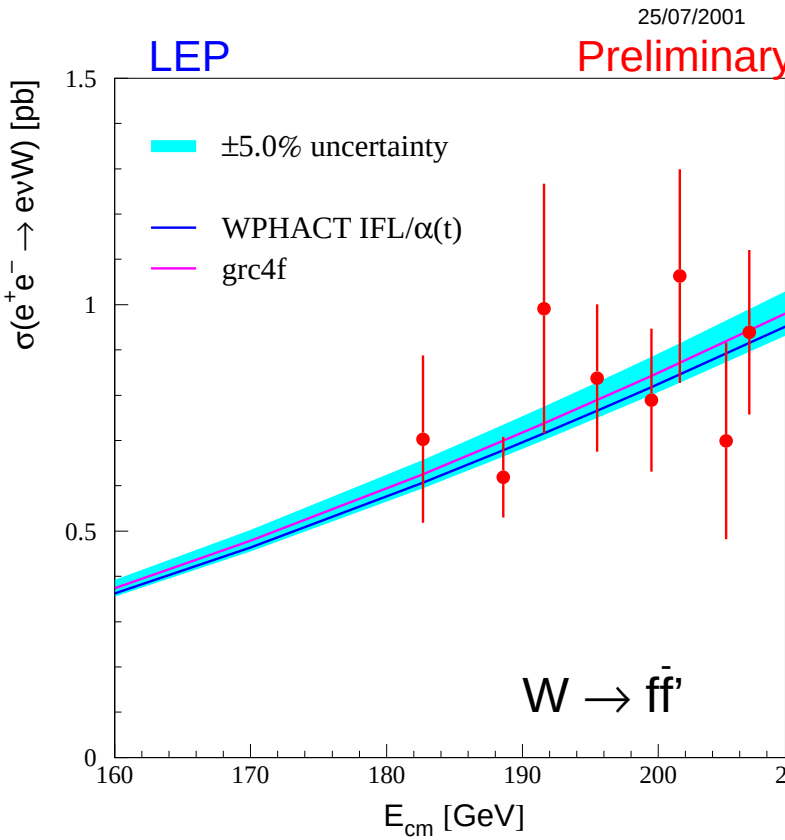
→ Statistical error will improve

- Largest correlated systematic: $\mathcal{O}(\alpha)$ corrections

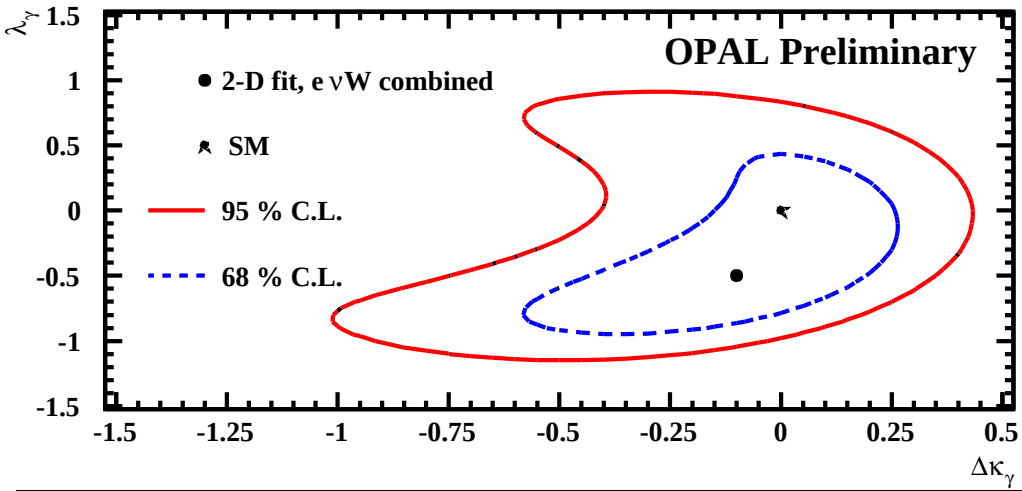
→ Need better understanding of theory error

Couplings of the W to other bosons: Single-W





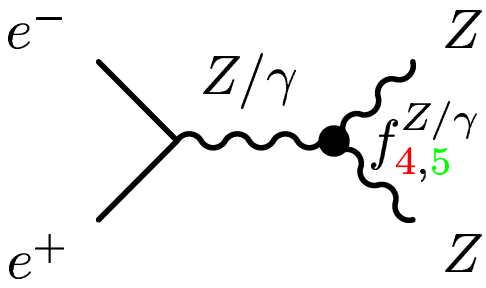
- Smaller sensitivity than WW
- WWγ vertex gives access to $\Delta\kappa_\gamma$ and λ_γ
- Single-W events are most sensitive to $\Delta\kappa_\gamma$



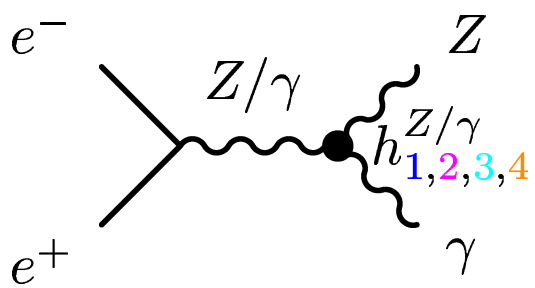
These results are included in the combined fits.

Couplings of three neutral bosons

Either ZZ in the final state



or $Z\gamma$ in the final state



- $h_1^{Z/\gamma}$, $h_2^{Z/\gamma}$ and $f_4^{Z/\gamma}$ are $\not{CP}$
- $h_3^{Z/\gamma}$, $h_4^{Z/\gamma}$ and $f_5^{Z/\gamma}$ conserve CP

$\rightarrow$ All these couplings vanish in the Standard Model at tree level

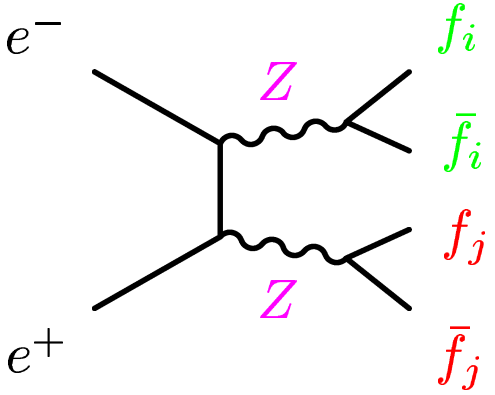
Similar to couplings of W, SU(2)×U(1) symmetry (hep-ph/0111283):

$$f_5^{Z/\gamma} = h_3^{Z/\gamma} \tan\theta_W$$
$$f_4^{Z/\gamma} = h_1^{Z/\gamma} \tan\theta_W$$

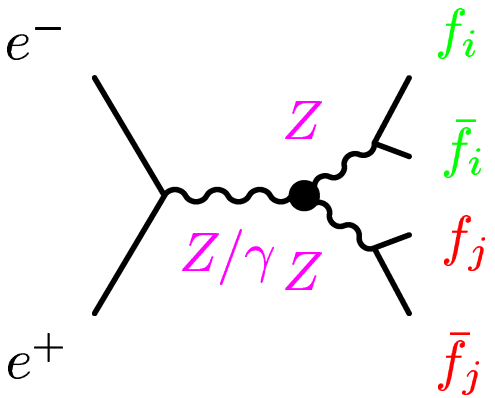
(yet to be done)

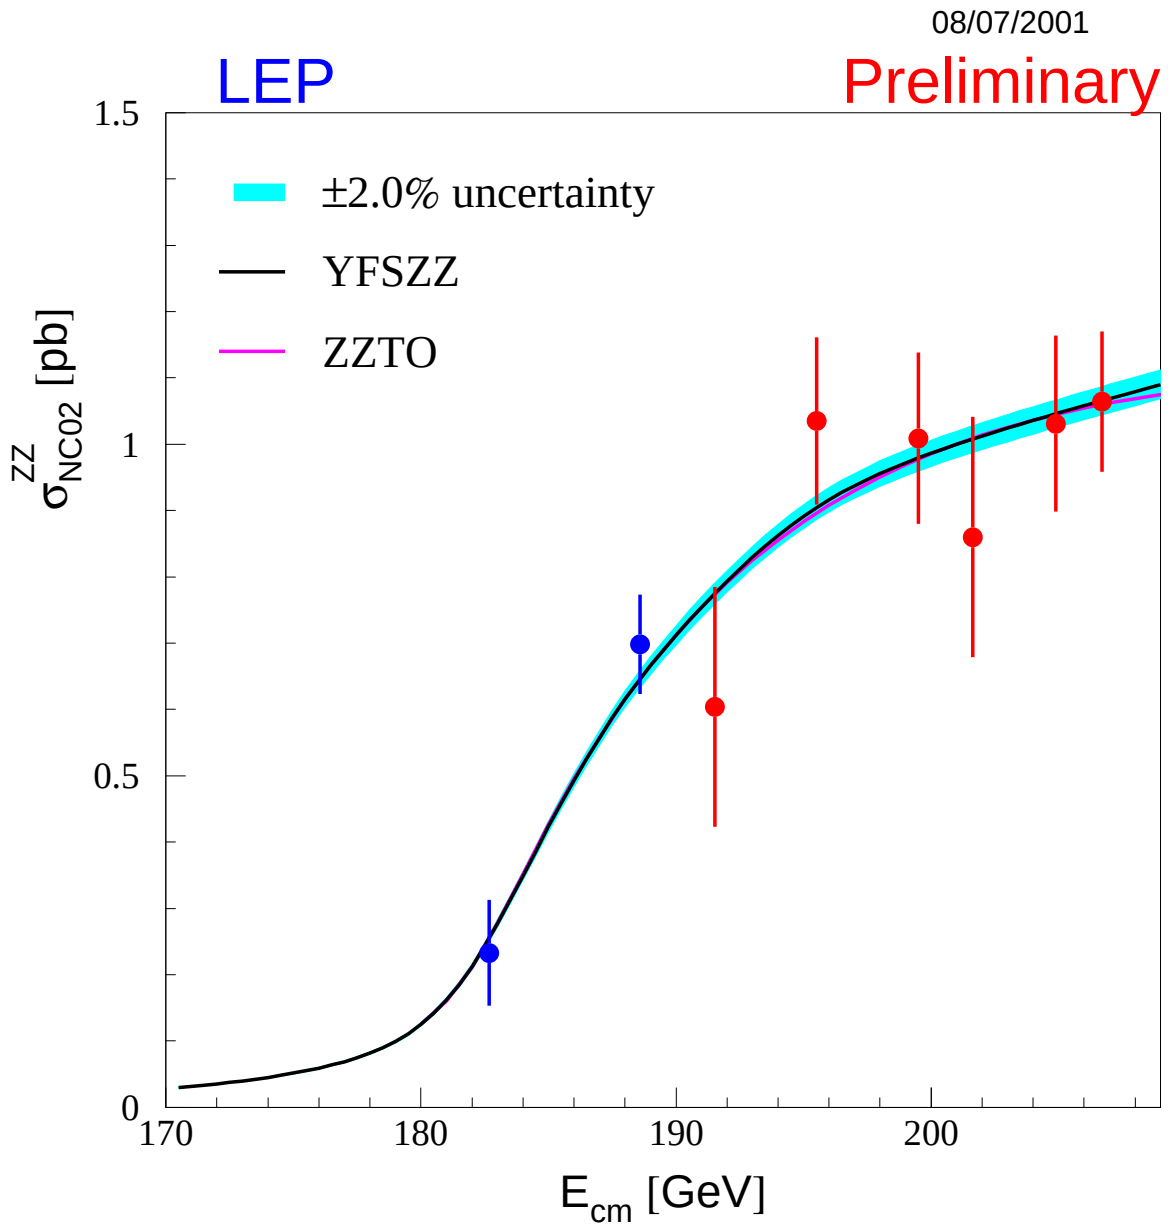
Couplings of three neutral bosons: ZZ

Standard Model

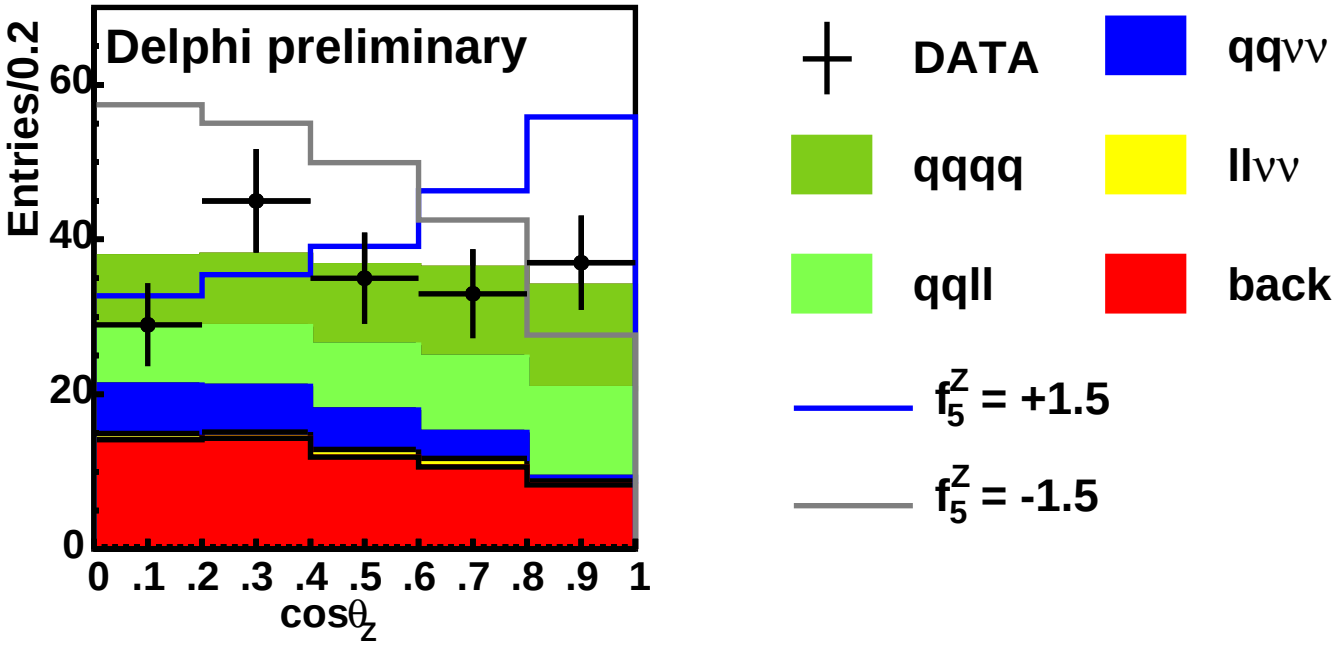


Anomalous couplings





Couplings of three neutral bosons: ZZ and f couplings

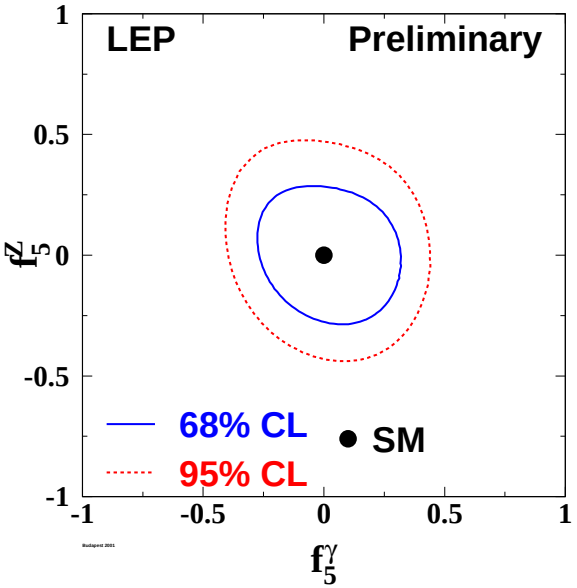


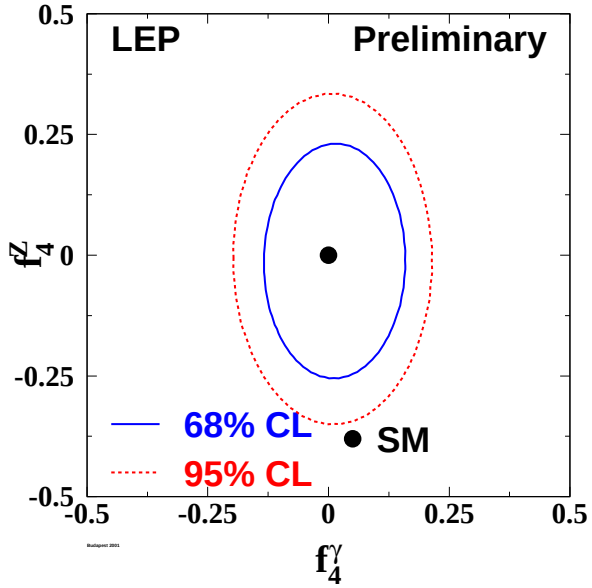
Limits at 95% CL:

$$CP$$

$$f_5^\gamma \quad [-0.34, 0.38]$$

$$f_5^Z \quad [-0.36, 0.38]$$



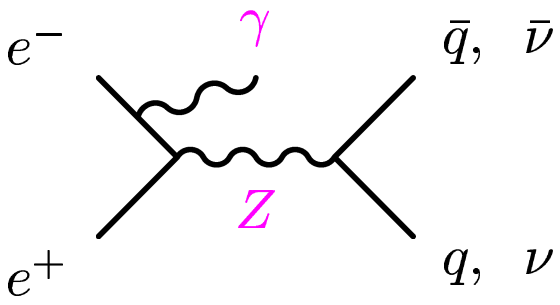


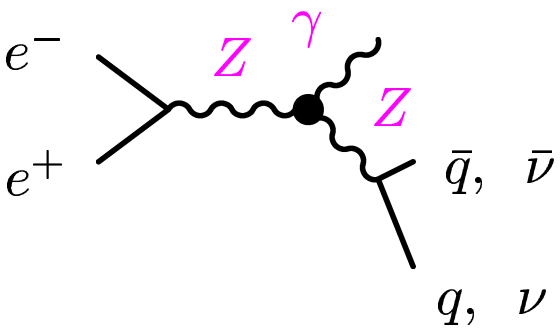
$$\not{CP}$$

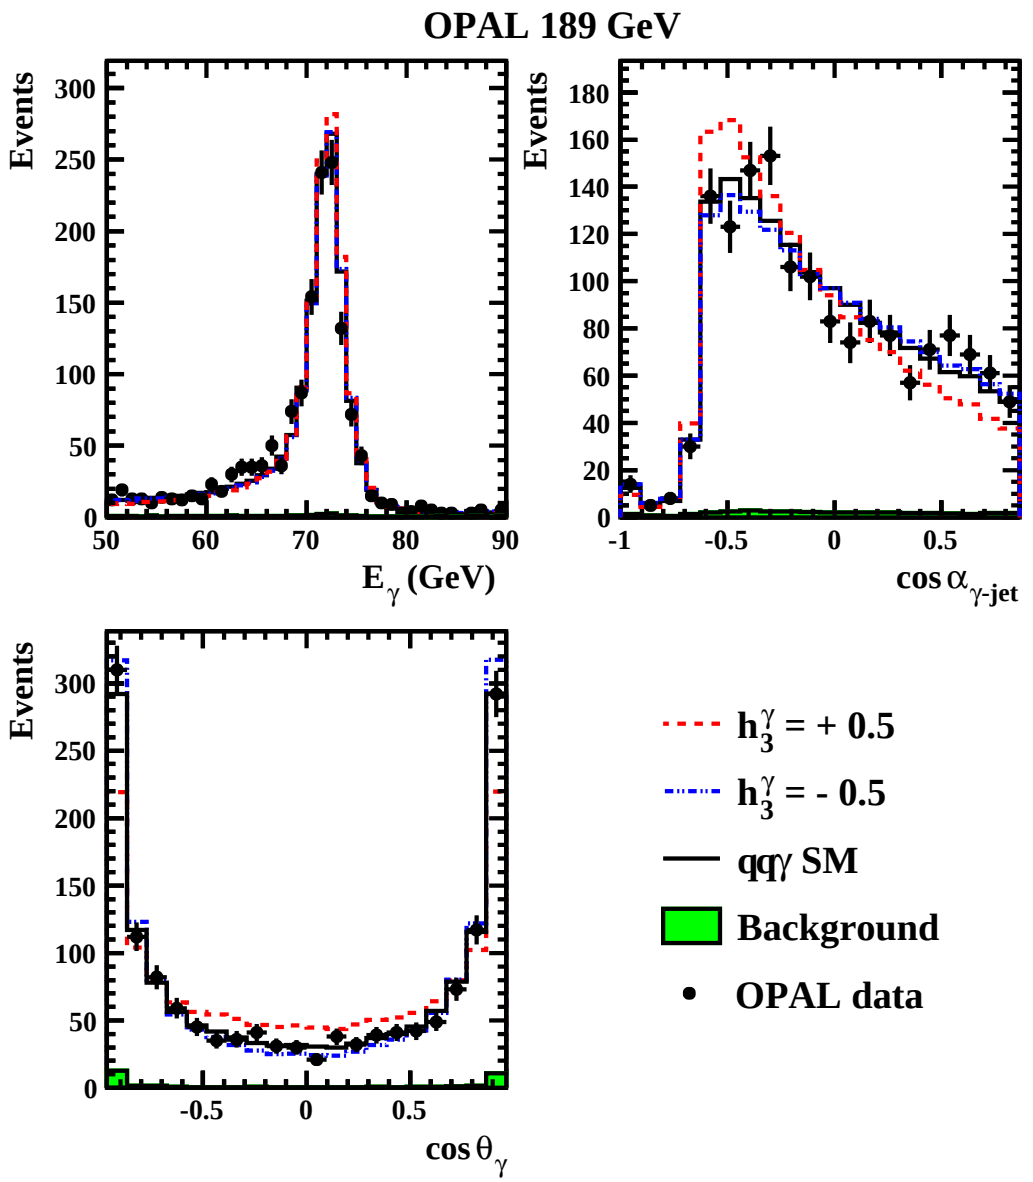
$$f_4^\gamma \quad [-0.17, 0.19]$$

$$f_4^Z \quad [-0.30, 0.28]$$

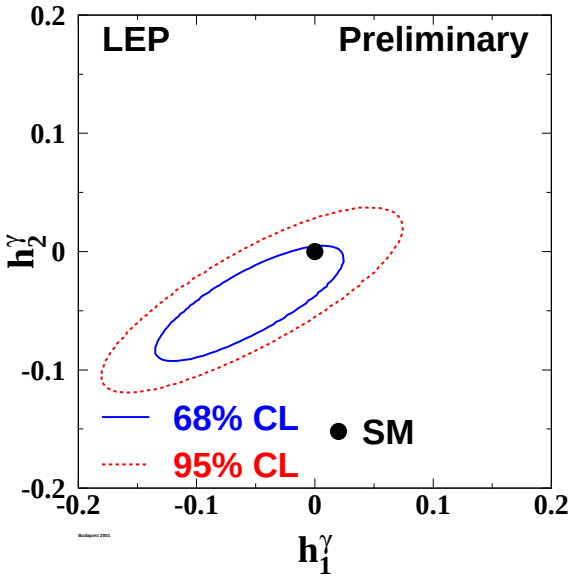
Couplings of three neutral bosons: $Z\gamma$

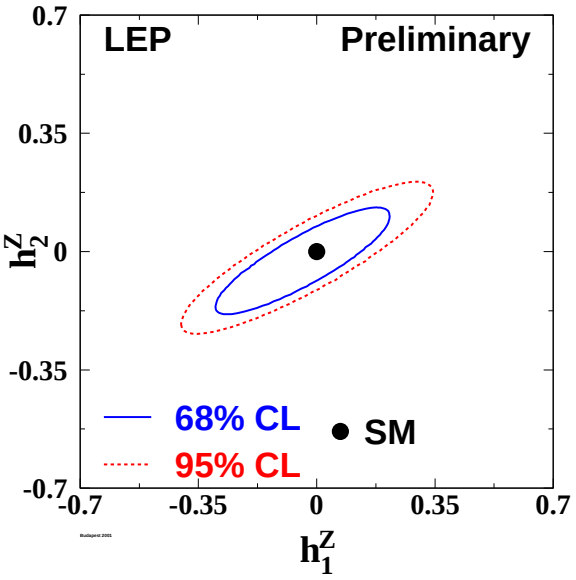






Couplings of three neutral bosons: $Z\gamma$

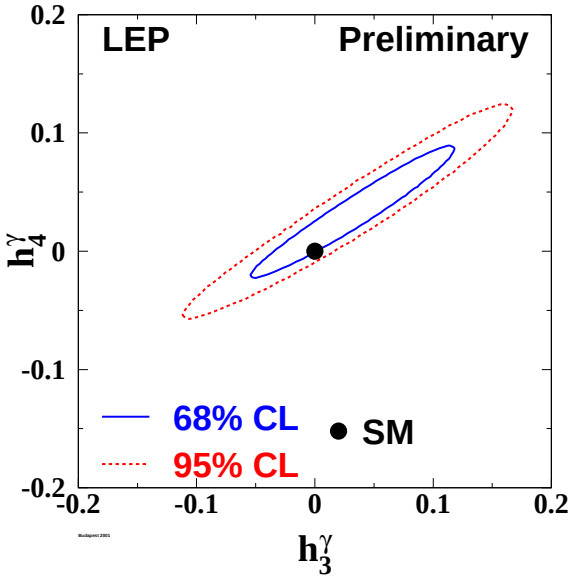


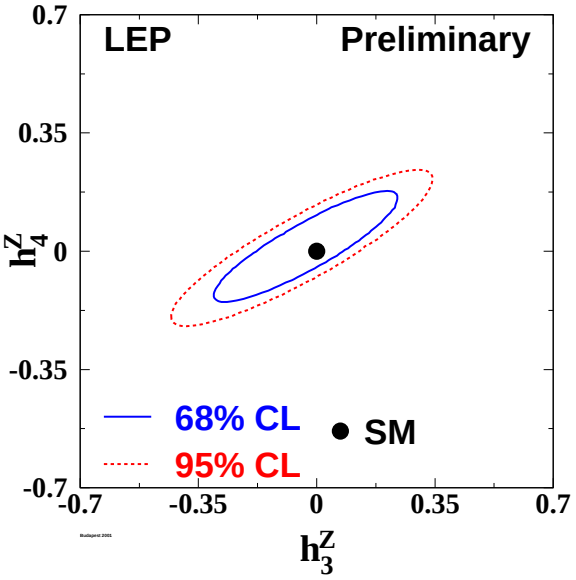


Limits at 95% CL:

$\not{CP}$

h_1^γ	$[-0.056, 0.055]$
h_2^γ	$[-0.045, 0.025]$
h_1^Z	$[-0.13, 0.13]$
h_2^Z	$[-0.078, 0.071]$



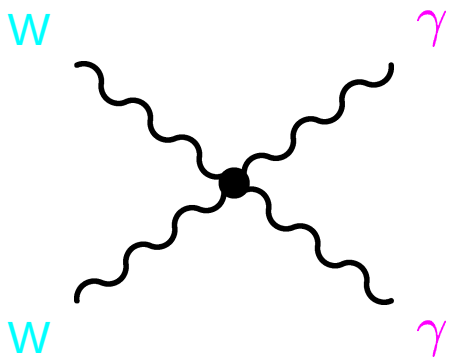


CP

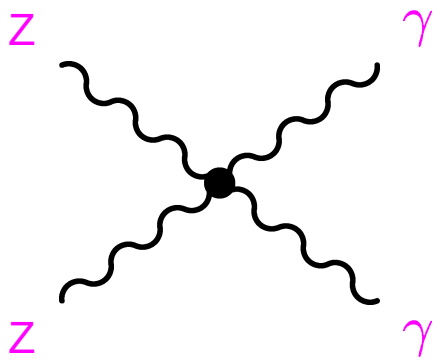
h_3^γ	$[-0.049, 0.008]$
h_4^γ	$[-0.002, 0.034]$
h_3^Z	$[-0.20, 0.07]$
h_4^Z	$[-0.05, 0.12]$

Quartic boson self-couplings

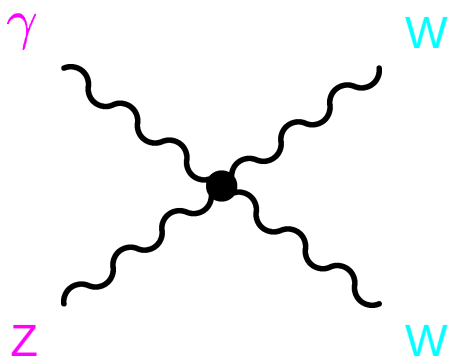
Consider the following vertices:



a_0^W a_c^W



a_0^Z a_c^Z



a_n

The anomalous contributions to these vertices are:

$$\mathcal{L}_0 = -\frac{e^2}{16}\frac{a_0^{W,Z}}{\Lambda^2} F^{\mu\nu}F_{\mu\nu}\vec{W}^{\alpha}\vec{W}_{\alpha} \qquad WW\gamma\gamma, ZZ\gamma\gamma$$

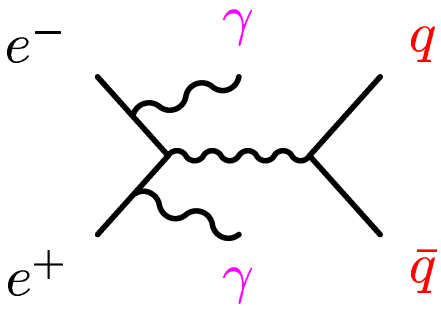
$$\mathcal{L}_c = -\frac{e^2}{16}\frac{a_c^{W,Z}}{\Lambda^2} F^{\mu\alpha}F_{\mu\beta}\vec{W}^{\beta}\vec{W}_{\alpha} \qquad WW\gamma\gamma, ZZ\gamma\gamma$$

$$\mathcal{L}_n = -\frac{e^2}{16}\frac{a_n}{\Lambda^2}\vec{W}_{\mu\alpha}\cdot(\vec{W}_{\nu}\times\vec{W}^{\alpha})F^{\mu\nu} \qquad WWZ\gamma$$

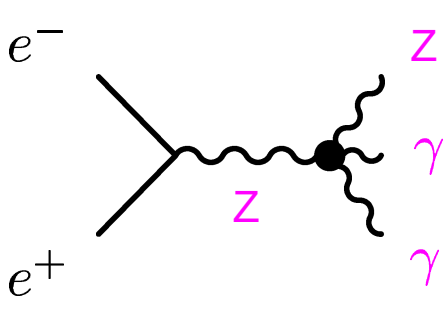
- Λ is the scale of new physics associated with these phenomena.
- a_0 and a_c conserve CP, whereas a_n violates CP.
- Couplings from Z could be different from W (here assumed to be the same)

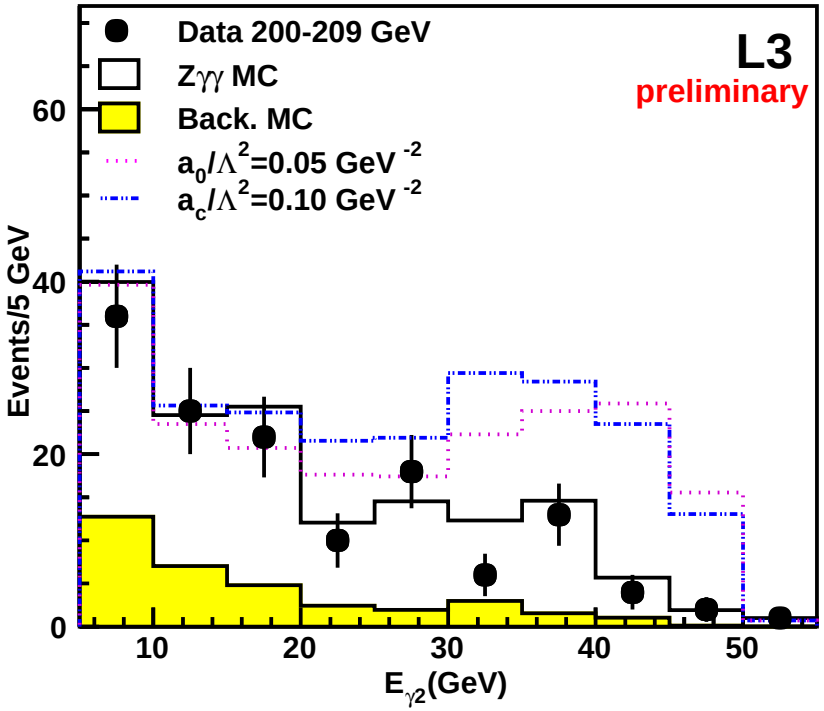
Quartic couplings: $Z\gamma\gamma$

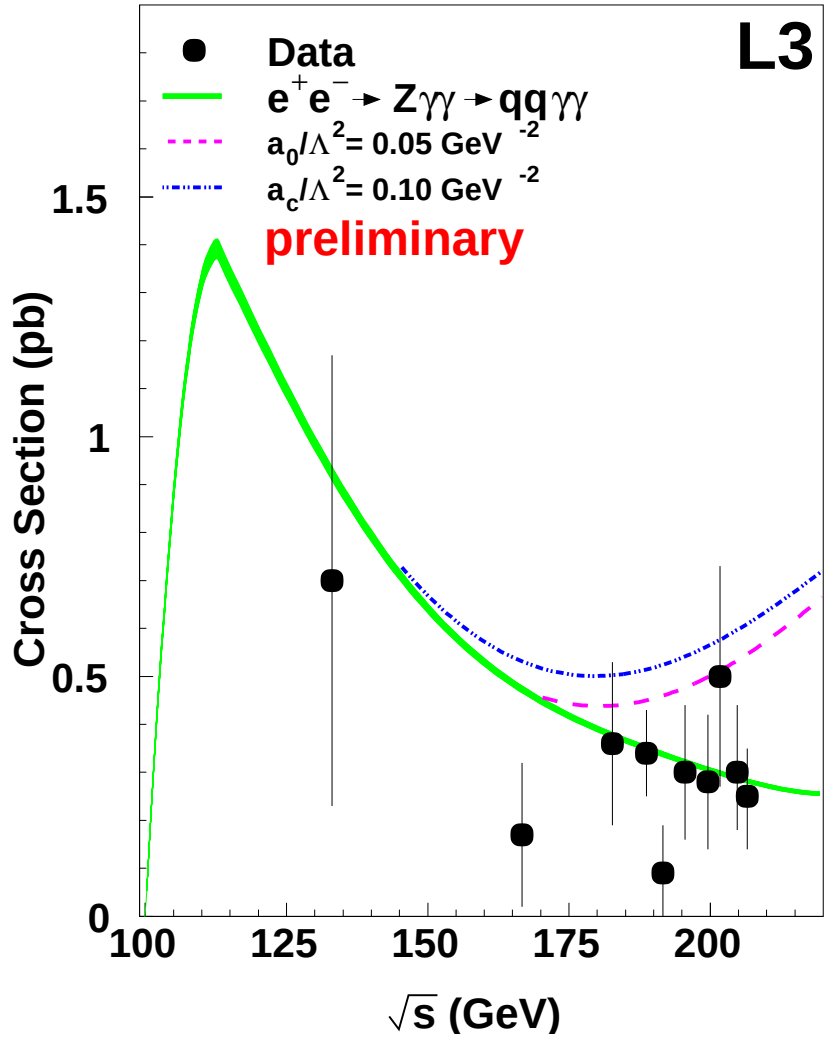
Standard Model:



Anomalous vertex:





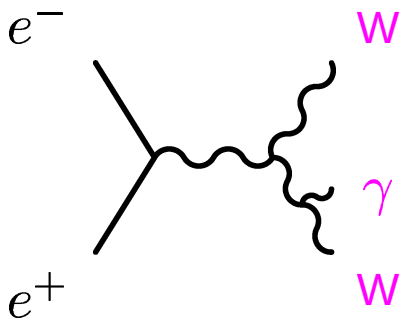


$$-0.02 \leq a_0/\Lambda^2 \times \text{GeV}^2 \leq 0.03$$

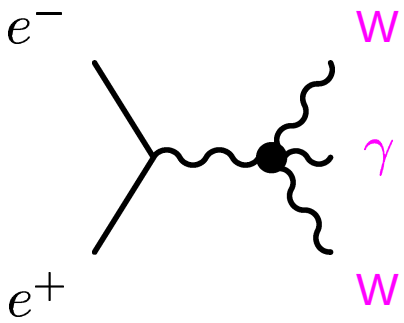
$$-0.07 \leq a_c/\Lambda^2 \times \text{GeV}^2 \leq 0.05$$

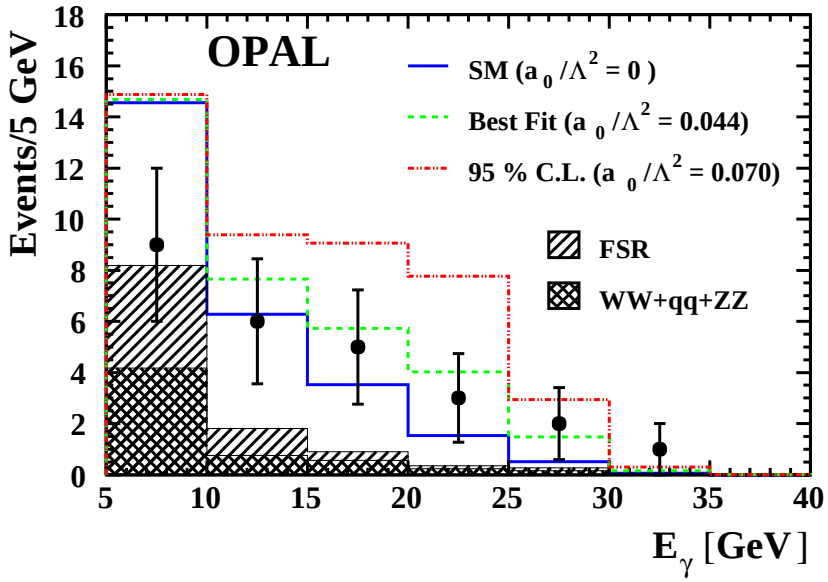
Quartic couplings: W$\gamma\gamma$

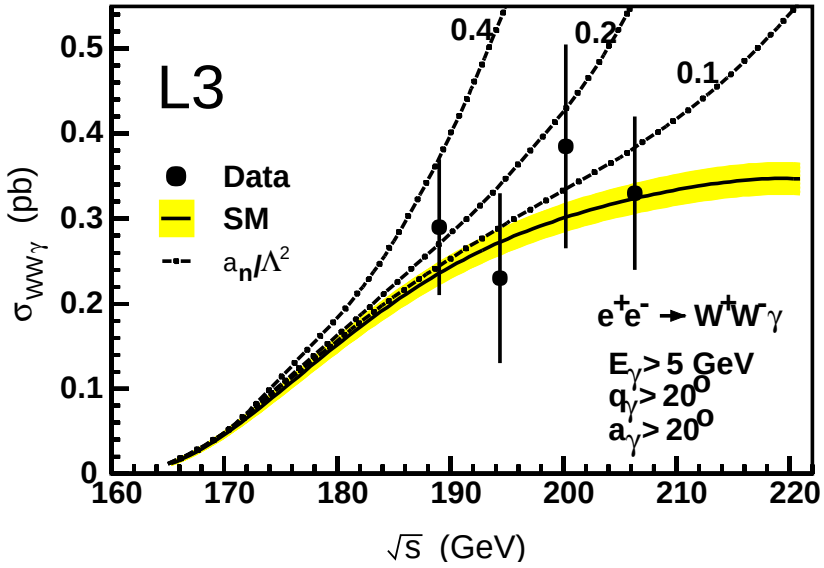
Standard Model:



Anomalous vertex:







LEP Combined limits for quartic couplings:

$$-0.02 \leq a_0/\Lambda^2 \times \text{GeV}^2 \leq 0.02$$

$$-0.03 \leq a_c/\Lambda^2 \times \text{GeV}^2 \leq 0.05$$

$$-0.17 \leq a_n/\Lambda^2 \times \text{GeV}^2 \leq 0.15$$

Conclusions

- The existence of the non-Abelian structure of the Standard Model has been proven by LEP experiments
- The γWW and ZWW couplings are in good agreement with prediction of the Standard Model
- Many other possible boson self-couplings have been studied

$\rightarrow$ No signifi cant deviation from the Standard Model has been found

$\Rightarrow$ The Standard Model continues to describe the data...

Correlated systematic errors
