

CMS Experiment at the LHC, CERN

Data recorded: 2011-Jun-25 06:34:20.986785 GMT(08:34:20 CEST)

Run / Event: 167675 / 876658967

Multi-boson production at ATLAS and CMS

[Roberto Covarelli](#) (*University / INFN of Torino*)
on behalf of the CMS and ATLAS collaborations

52nd Rencontres de Moriond on QCD and High Energy Interactions
La Thuile, 25 Mar-1 Apr 2017

R. Covarelli

Multi-boson inclusive production

- ▶ **Leading-order** and with **additional strong vertices**
 - ▶ $\mathcal{O}(10 \text{ pb})$ @ LHC energies
 - ▶ **High-order corrections** are large because **new initial states** come into play
 - ▶ NLO known for years (e.g. POWHEG method)

Nason and Zanderighi, *Eur.Phys.J.* **C74** (2014) 2702, etc.

- ▶ **NNLO** became **available very recently** for basically all processes (2 γ NNLO, MATRIX)

Catani et al., *PRL* **108** (2012) 072001

Cascioli et al., *PLB* **735** (2015) 211, etc.

- ▶ Consistency with SM can be translated in **limits on anomalous triple gauge couplings (aTGC)**

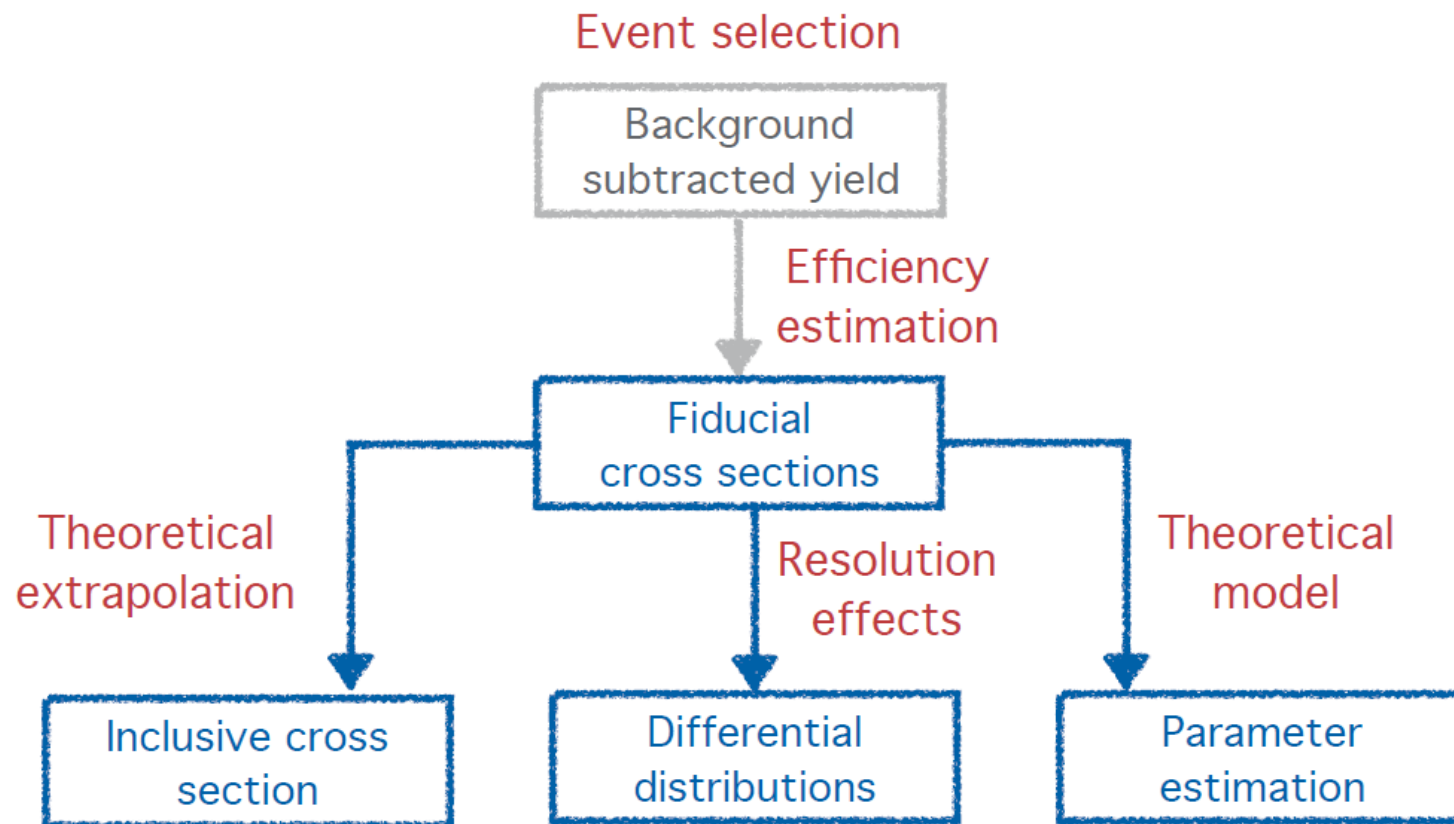

Multi-boson production with 2 jets

- ▶ Includes diagrams with **gauge self-interactions** («Vector-Boson Scattering», VBS)
 - ▶ $\sigma(10-100 \text{ fb})$ @ LHC energies, NLO QCD calculations available,
 - e.g. Bozzi et al., *Phys.Rev.* **D75** (2007) 073004,
 - Jaeger et al., *Phys.Rev.* **D80** (2009) 034022, etc.
 - ▶ **Experimentally very challenging:** large contamination from
 - ▶ QCD production + 2 jets
 - ▶ Other EWK processes (e.g. tribosons with a weak boson decaying to $q\bar{q}$)
 - ▶ Helps in understanding nature of electro-weak symmetry breaking
 - ▶ Main experimental probe of **anomalous quartic gauge couplings (aQGC)**

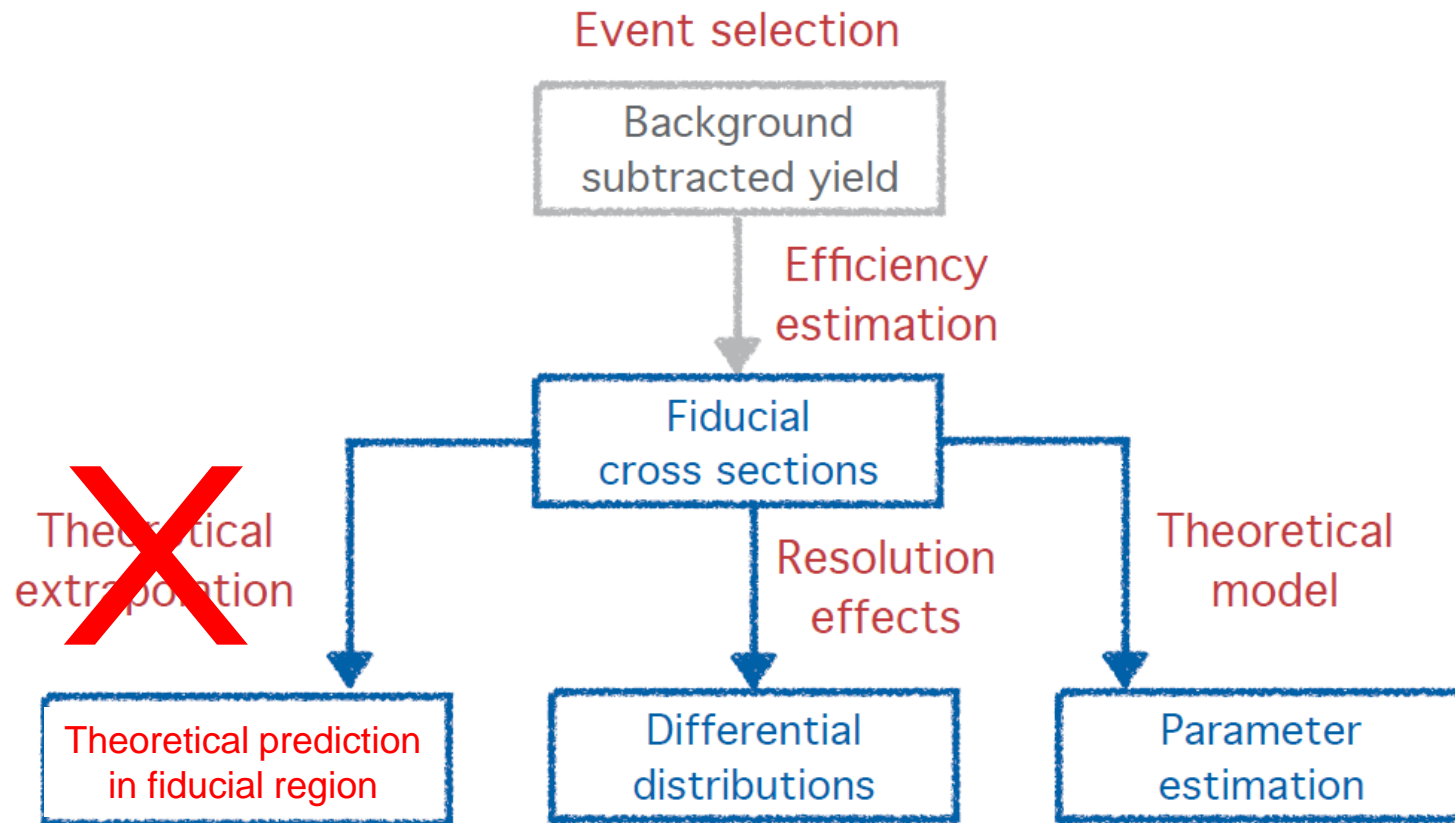

R. Covar

Experimental output

R. Lopes de Sà @ ICHEP2016

Experimental output

R. Lopes de Sà @ ICHEP2016

Inclusive and fiducial cross-section measurements

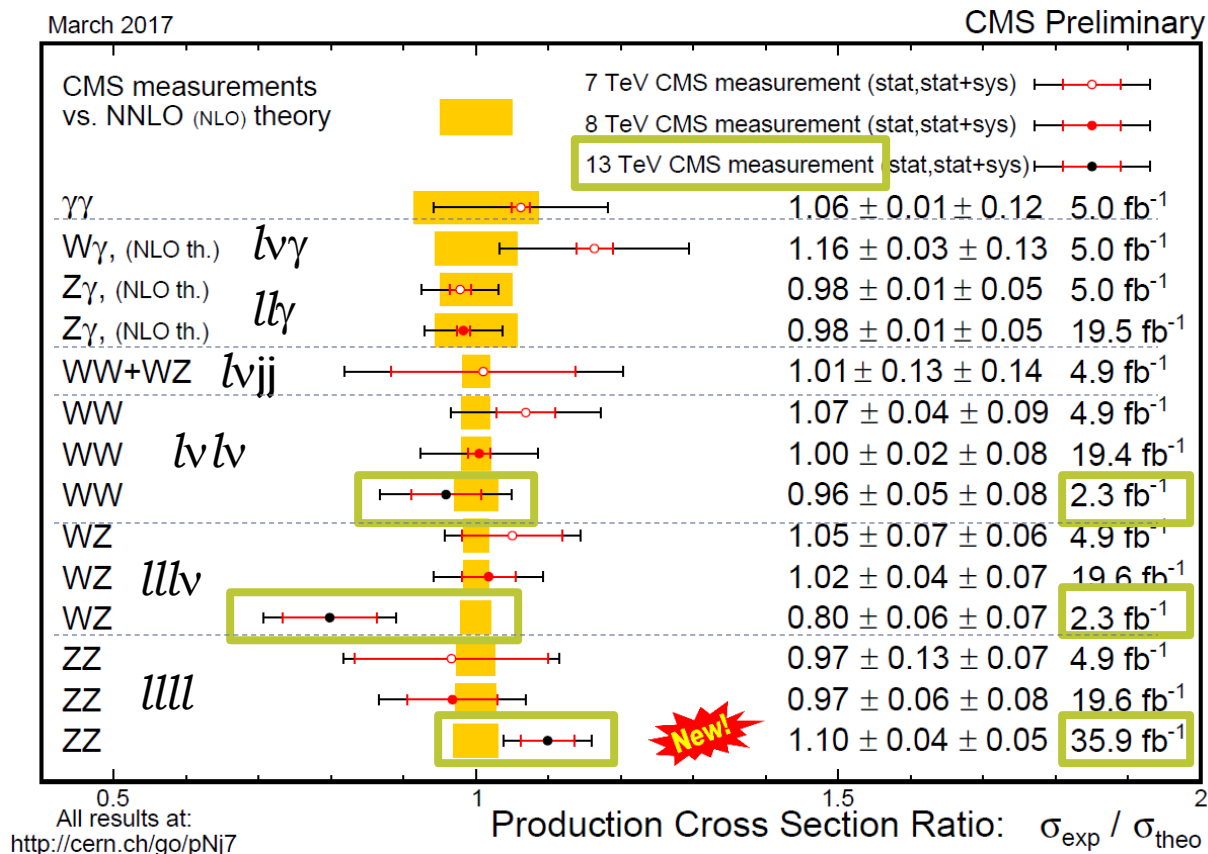

CMS summary

▶ **Very good agreement with SM expectations**

▶ Theory uncertainties: NLO ~ 5-10%, **NNLO << 5%**

▶ Experimental uncertainties: **Systematic-to-statistical ratio** depends mostly on the **visible weak-boson decays** (vast majority of analyses use **leptonic final-states only**, while semi-leptonic WW+WZ exists)

ATLAS summary

Diboson Cross Section Measurements

Status: August 2016

▶ Similar uncertainties

- ▶ $W\gamma$ theory expectation at NNLO improves agreement with data (also true for CMS)
- ▶ CMS WZ deficit at 13 TeV not confirmed
 - ▶ ZZ needs more data
- ▶ $Z \rightarrow \nu\nu$ final states used: in some cases competitive with $Z \rightarrow ll$

EWK production and tri-bosons

- ▶ Several measurements **without a significant observation yet**
 - ▶ Mostly Run I
 - ▶ Some EWK final states missing (most notably ZZjj)

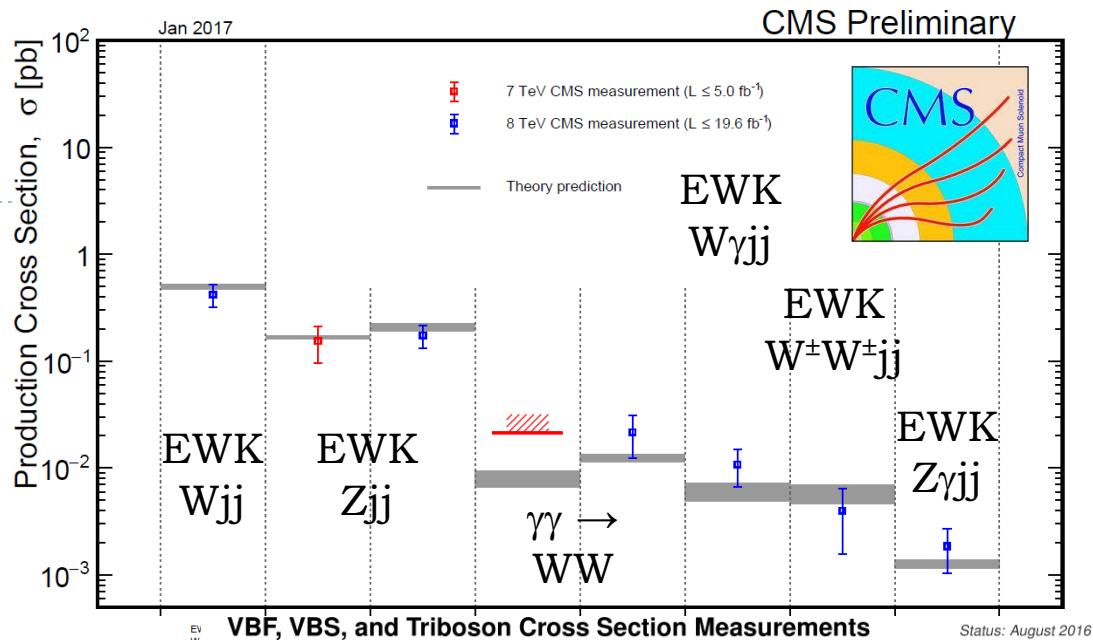

- ▶ ATLAS reports **modest excesses in $V\gamma\gamma$ ($\sim 2\sigma$)**, smaller in jet-vetoed
 - ▶ CMS **does not observe** the same effect

$$\sigma_{W^\pm\gamma\gamma}^{\text{fid}} \cdot \text{BR}(W \rightarrow \ell\nu) = 6.0 \pm 1.8 (\text{stat}) \pm 2.3 (\text{syst}) \pm 0.2 (\text{lumi}) \text{ fb}$$

$$\sigma_{W^\pm\gamma\gamma}^{\text{NLO}} \cdot \text{BR}(W \rightarrow \ell\nu) = 4.76 \pm 0.53 \text{ fb}$$

$$\sigma_{Z\gamma\gamma}^{\text{fid}} \cdot \text{BR}(Z \rightarrow \ell\ell) = 12.7 \pm 1.4 (\text{stat}) \pm 1.8 (\text{syst}) \pm 0.3 (\text{lumi}) \text{ fb}$$

$$\sigma_{Z\gamma\gamma}^{\text{NLO}} \cdot \text{BR}(Z \rightarrow \ell\ell) = 12.95 \pm 1.47 \text{ fb}$$

Tri-bosons

VBS

Results on anomalous gauge couplings

Anomalous gauge couplings

- ▶ Triple and quartic gauge couplings
 - ▶ Non-zero in SM: $WW\gamma$ / WWZ / $WW\gamma\gamma$... etc.
 - ▶ Zero in SM: $Z\gamma\gamma$ / $ZZ\gamma$ / ZZZ / $ZZ\gamma\gamma$... etc.
- ▶ **Anomalous couplings** defined in different approaches:
 - ▶ Modifying **couplings in SM Lagrangian** ($\Delta g_1^V, \Delta \kappa^V, \lambda^V$) or, equivalently, introducing **effective extra vertices** (h_3^V, h_4^V / f_4^V, f_5^V)
 - ▶ In **effective field theory**, in terms of Wilson coefficients c_i and New Physics scales

See e.g.: Degrande et al., *Ann. Phys.* **335** (2013) 21

 - ▶ Caveat: need for a **form factor** $\alpha_s(\hat{s}) = \frac{\alpha_s(0)}{(1+\hat{s}/\Lambda_{FF})^n}$ to preserve tree-level unitarity. **Often set** $\Lambda_{FF} \rightarrow \infty$ in comparing experimental results for consistency \rightarrow can have a substantial weakening effect on aGC limits if $\Lambda_{FF} = o(\text{TeV})$

Selected recent results

EWK-produced $W\gamma$ and $Z\gamma$

► CMS: 8 TeV

arXiv:1612.09256 (submitted to *JHEP*)
 arXiv:1702.03025 (submitted to *PLB*)

- Select events with two jets at high invariant mass (m_{jj})
- Backgrounds other than QCD $V\gamma$ production → data-driven methods
- Extract aQGC limits from $p_T(W)$ ($W\gamma$) or $m_{Z\gamma}$ ($Z\gamma$) distributions

Fiducial cross sections (EWK production)

$W\gamma$: 10.8 ± 4.1 (stat) ± 3.4 (syst) ± 0.3 (lumi) fb **VBFNLO: 6.1 ± 1.2 fb**

$Z\gamma$: $1.86^{+0.90}_{-0.75}$ (stat) $^{+0.34}_{-0.26}$ (syst) ± 0.05 (lumi) fb **MadGraph LO: 1.27 ± 0.13 fb**

EWK-produced $Z\gamma$

▶ ATLAS 8 TeV: combination of $l\gamma jj$ and $\nu\nu\gamma jj$ channels

- ▶ Fiducial cross-section extracted from $Z\gamma$ centrality

ATLAS-STD-2015-21
(paper in preparation)

distributions: $\zeta = \left| \frac{\eta_{Z\gamma} - \bar{\eta}_{jj}}{\Delta\eta_{jj}} \right|$

- ▶ aQGCs: look for excesses in E_T^γ

Most stringent limits on f_{2M} and f_{3M} (not accessible by EWK $W^\pm W^\pm$)

$$\sigma_{Z\gamma jj}^{EWK} = 1.1 \pm 0.5 \text{ (stat)} \pm 0.4 \text{ (syst) fb}$$

2 σ significance

$$\sigma_{Z\gamma jj}^{VBFNLO,EWK} = 0.94 \pm 0.09 \text{ (theo) fb.}$$

WW and WZ with a merged jet

► CMS: semi-leptonic $l\nu q\bar{q}$ channel at 8 TeV

arXiv:1702.06095 (submitted to PLB)

- At high W/Z p_T , quarks from boson decays merge into a single, large-radius jet]
 - «Pruned» invariant mass of jet constituents and jet substructure reducing huge W+jets and $t\bar{t}$ backgrounds
 - aTGC limits extracted from $p_T(j)$ distributions

WW and WZ at 13 TeV

- ▶ ATLAS: fully leptonic $e\nu\mu\nu$ and $ll\nu\nu$ at 13 TeV
- ▶ Both very pure signals (S/B ~ 4)
 - ▶ WW: compute inclusive fiducial cross-section, compare to NNLO calculations
 - ▶ WZ: fiducial cross-section, differential in $p_T(W)$ and $m_T(WZ)$, updated aTGC limits

ATLAS-CONF-2016-043
arXiv:1702.04519 (submitted to PLB)

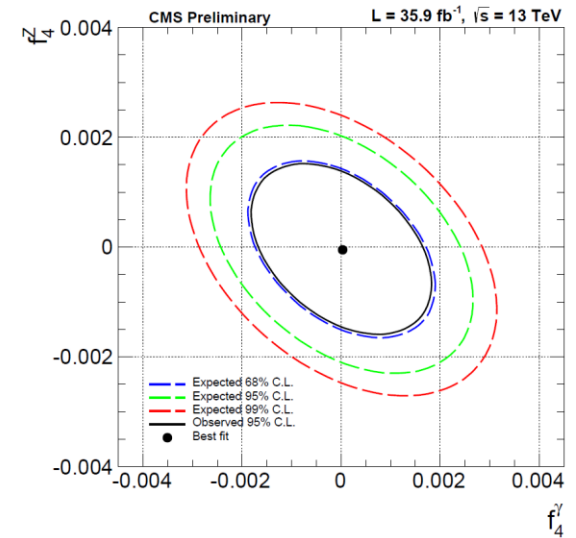

$$\sigma_{WW \rightarrow e\mu}^{\text{fid}} = 529 \pm 20 \text{ (stat.)} \pm 50 \text{ (syst.)} \pm 11 \text{ (lumi.) fb.}$$

ZZ at 13 TeV

- ▶ First diboson result with full 2016 dataset (35.9 fb⁻¹) at 13 TeV, using 4l final state
 - ▶ Very pure final state, larger background from Z+jets with fake leptons → estimated in control regions
 - ▶ Z resonant region → extract BR(Z → 4l)
 - ▶ ZZ region (including Higgs) → fiducial cross-section and aTGC limits from m_{ZZ} distribution

$$\mathcal{B}(Z \rightarrow 4\ell) = 4.74^{+0.16}_{-0.16} (\text{stat})^{+0.18}_{-0.17} (\text{syst}) \pm 0.08 (\text{theo}) \pm 0.12 (\text{lumi}) \times 10^{-6},$$

R. Covarelli

5% uncertainty

Conclusions

- ▶ The numerous **multi-boson production** measurements in **ATLAS** and **CMS** performed so far show **good agreement with the SM**
 - ▶ Total **experimental uncertainties** and statistical / systematic balance vary a lot **depending on the final states**
- ▶ **On the way to precision measurements**
 - ▶ Search for fully **electro-weak diboson production in all channels**
 - ▶ Search for **triple weak-boson production**
 - ▶ Precise **differential measurements** (at high invariant mass, large jet multiplicities...)
- ▶ **Impressive improvements in theory tools**
 - ▶ **NNLO QCD calculations** available for almost all processes with possibility to compare to «fiducial» experimental results
 - ▶ What else is needed from the experiments' side?
 - ▶ At which point will NLO EWK corrections start to be important?
 - ▶ $VV + n$ jets ($n \geq 2$) in QCD: impact of parton shower choices?
