Constraining models with extra heavy
gauge bosons using LHC measurements

Mohammad Mahdi ALTAKACH

In collaboration with J.M. Butterworth, T. Jezo, M. Klasen, J.-N. Lang, and I. Schienbein

DAAD

EW top pair hadroproduction in the presence of heavy **Z'** and **W'** bosons at **NLO QCD** in **POWHEG**

M. M. AlTakach, T. Jezo, M. Klasen, J.-N. Lang, I. Schienbein [[arXiv:2012.14855](#)]

Introduction

- New heavy resonances are predicted in a variety of models with extra $U(1)$ or $SU(2)$
- In many cases, the resonance can decay **leptonically** and the **strongest constraints** come from searches with **leptonic final states**
- Nevertheless, **final states** with **top-quarks** are very interesting:
 - The heavy **top-quark** may play a special role w.r.t. to **EWSB** and **BSM** physics which couples preferentially to the **third generation** or not to **leptons**
 - Even for models with couplings to **leptons**, the addition of **top-quark** observables is important to distinguish between different **BSM** scenarios

The calculation

- We performed a **complete new calculation** of **EW top** pair production at the **LHC** including a **number of improvements** with respect to a previous one done in [\[arXiv:1511.08185\]](#):
- The amplitudes have been calculated using the **Recola2** package:
 - **Recola2** (**RE**cursive **C**omputation of **O**ne-**L**oop **A**mplitudes)
 - Publicly available at: <https://recola.hepforge.org>
 - **EW** and **QCD** amplitudes for **BSM** models at **NLO** [Denner, Lang, Uccirati; 1705.06053]
- The amplitudes were implemented in **Monte Carlo Event Generators (MCEG)** (within the **POWHEG BOX** framework)
- First use case of **Recola2 BSM** amplitudes in **NLO+PS** matched calculation
- The calculation now includes **t-channel W** and **W'** contributions

The calculation

- We performed a **complete new calculation** of **EW top** pair production at the **LHC** including a **number of improvements** with respect to a previous one done in [\[arXiv:1511.08185\]](#):
 - The new code can deal with **general couplings** for both **Z'** & **W'**

- **Standard Model** (γ , **Z** , **W**) and **new physics** (**Z'** , **W'**) interference effects taken into account

The calculation

- We performed a **complete new calculation** of **EW top** pair production at the **LHC** including a **number of improvements** with respect to a previous one done in [\[arXiv:1511.08185\]](#):
 - The new code can deal with **general couplings** for both **Z'** & **W'**

- **Standard Model** (γ , Z , W) and **new physics** (Z' , W') interference effects taken into account

The new calculation was validated against the old one finding

Full agreement

Top-pair hadroproduction

The partonic **top-quark** pair production cross section at **NLO**:

$$\sigma_{ab}(\mu_r) = \sigma_{1;1}(\alpha_S \alpha) + \sigma_{2;0}(\alpha_S^2) + \sigma_{0;2}(\alpha^2) + \sigma_{3;0}(\alpha_S^3) + \sigma_{2;1}(\alpha_S^2 \alpha) + \sigma_{1;2}(\alpha_S \alpha^2) + \sigma_{0;3}(\alpha^3)$$

Top-pair hadroproduction

The partonic **top-quark** pair production cross section at **NLO**:

$$\sigma_{ab}(\mu_r) = \sigma_{1;1}(\alpha_S \alpha) + \boxed{\sigma_{2;0}(\alpha_S^2)} + \sigma_{0;2}(\alpha^2) + \boxed{\sigma_{3;0}(\alpha_S^3)} + \sigma_{2;1}(\alpha_S^2 \alpha) + \sigma_{1;2}(\alpha_S \alpha^2) + \sigma_{0;3}(\alpha^3)$$

- $\sigma_{2;0}$: **SM QCD**

- $\sigma_{1;1}$: Interference between **QCD** & **EW top-quark** pair production
- $\sigma_{0;2}$: **EW top-quark** pair production
- $\sigma_{1;2}$: **NLO QCD** corrections to **EW top-quark** pair production
- $\sigma_{0;3}$: **EW** corrections to **EW top-quark** pair production

Testing new-physics models with global comparisons to collider measurements: the **Contur** toolkit

A. Buckley et al. [\[arXiv:2102.04377\]](#)

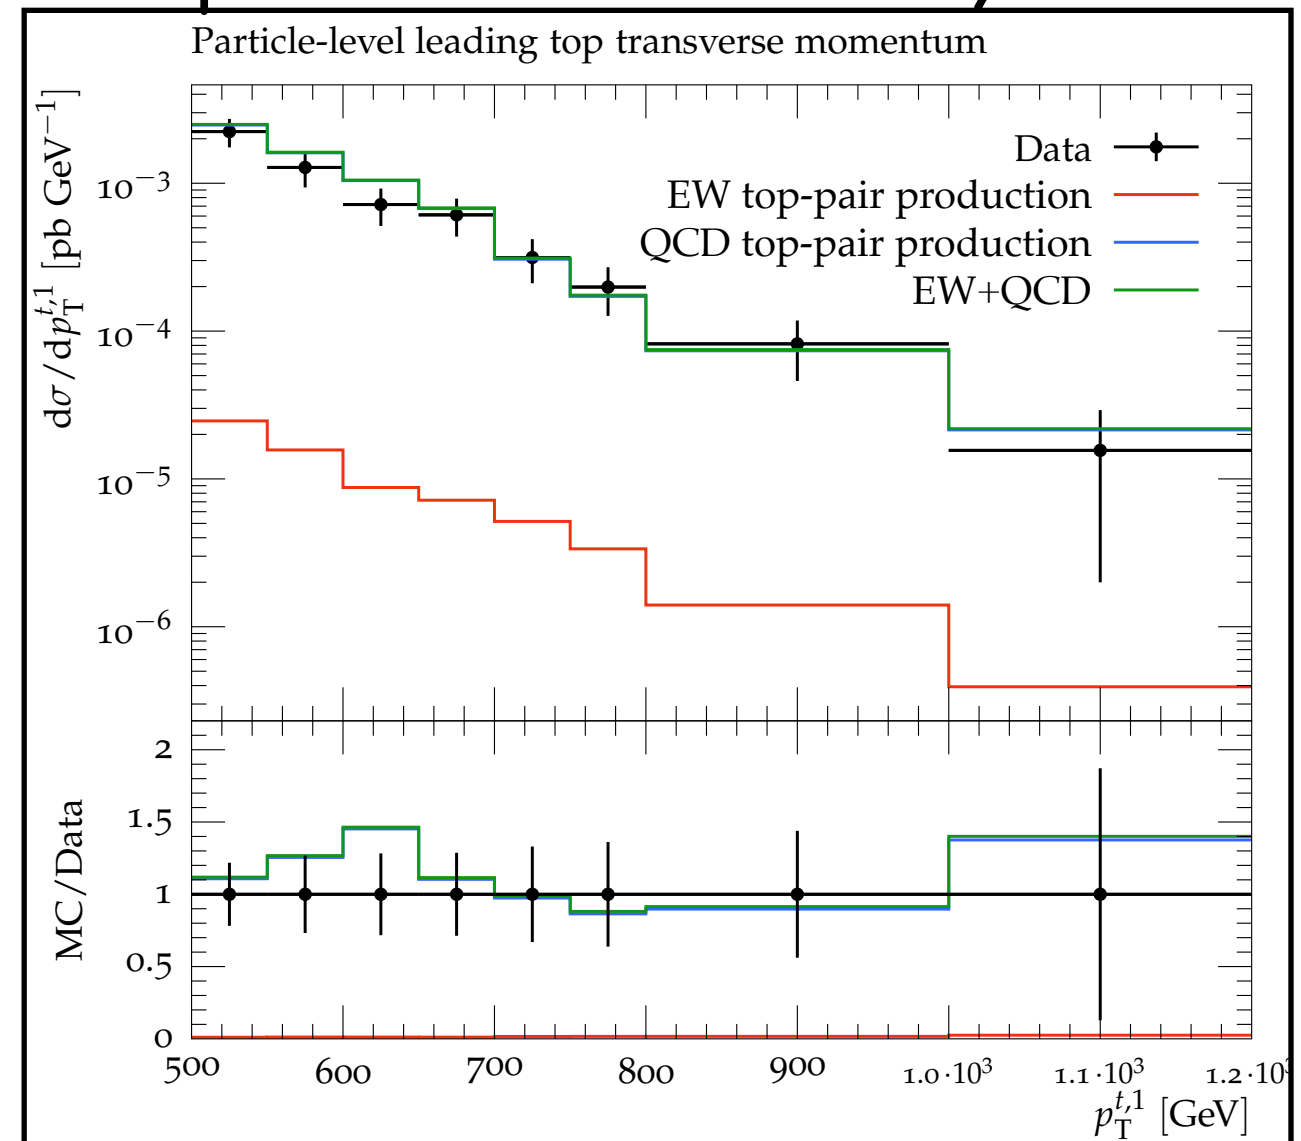

Contur

- **Question** for any given **BSM** proposal:
“at what significance do existing measurements already exclude this?”
- **Constraints On New Theories Using Rivet**
- Exploits the fact that **particle-level** differential measurements made in fiducial regions of phase space have a high degree of model independence
- These measurements can therefore be compared to **BSM** physics implemented in **MC** generators in a very generic way

Rivet

- **R**obust **I**ndependent **V**alidation of **E**xperiment and **T**heory

- Preservation of particle-collider analyses logic
- Tuning of non perturbative parameters
- Validation and improvement of **MCEG** codes
- Analysis reinterpretation via **MC** simulations

Rivet

- **R**obust **I**ndependent **V**alidation of **E**xperiment and **T**heory

- Preservation of particle-collider analyses logic
- Tuning of non perturbative parameters
- Validation and improvement of **MCEG** codes
- Analysis reinterpretation via **MC** simulations

Rivet

- **R**obust **I**ndependent **V**alidation of **E**xperiment and **T**heory

- Preservation of particle-collider analyses logic
- Tuning of non perturbative parameters
- Validation and improvement of **MCEG** codes
- Analysis reinterpretation via **MC** simulations

Contur uses bank of **LHC** results preserved in **Rivet** to rapidly check if new models are already ruled out

The Contur method

- **1st Approach:**

- Striking signals
- Data which agree with **SM** calculation
- Data = **SM**
- Uncertainties on the data define the room left for **BSM** signatures

The Contur method

- **2nd Approach:**

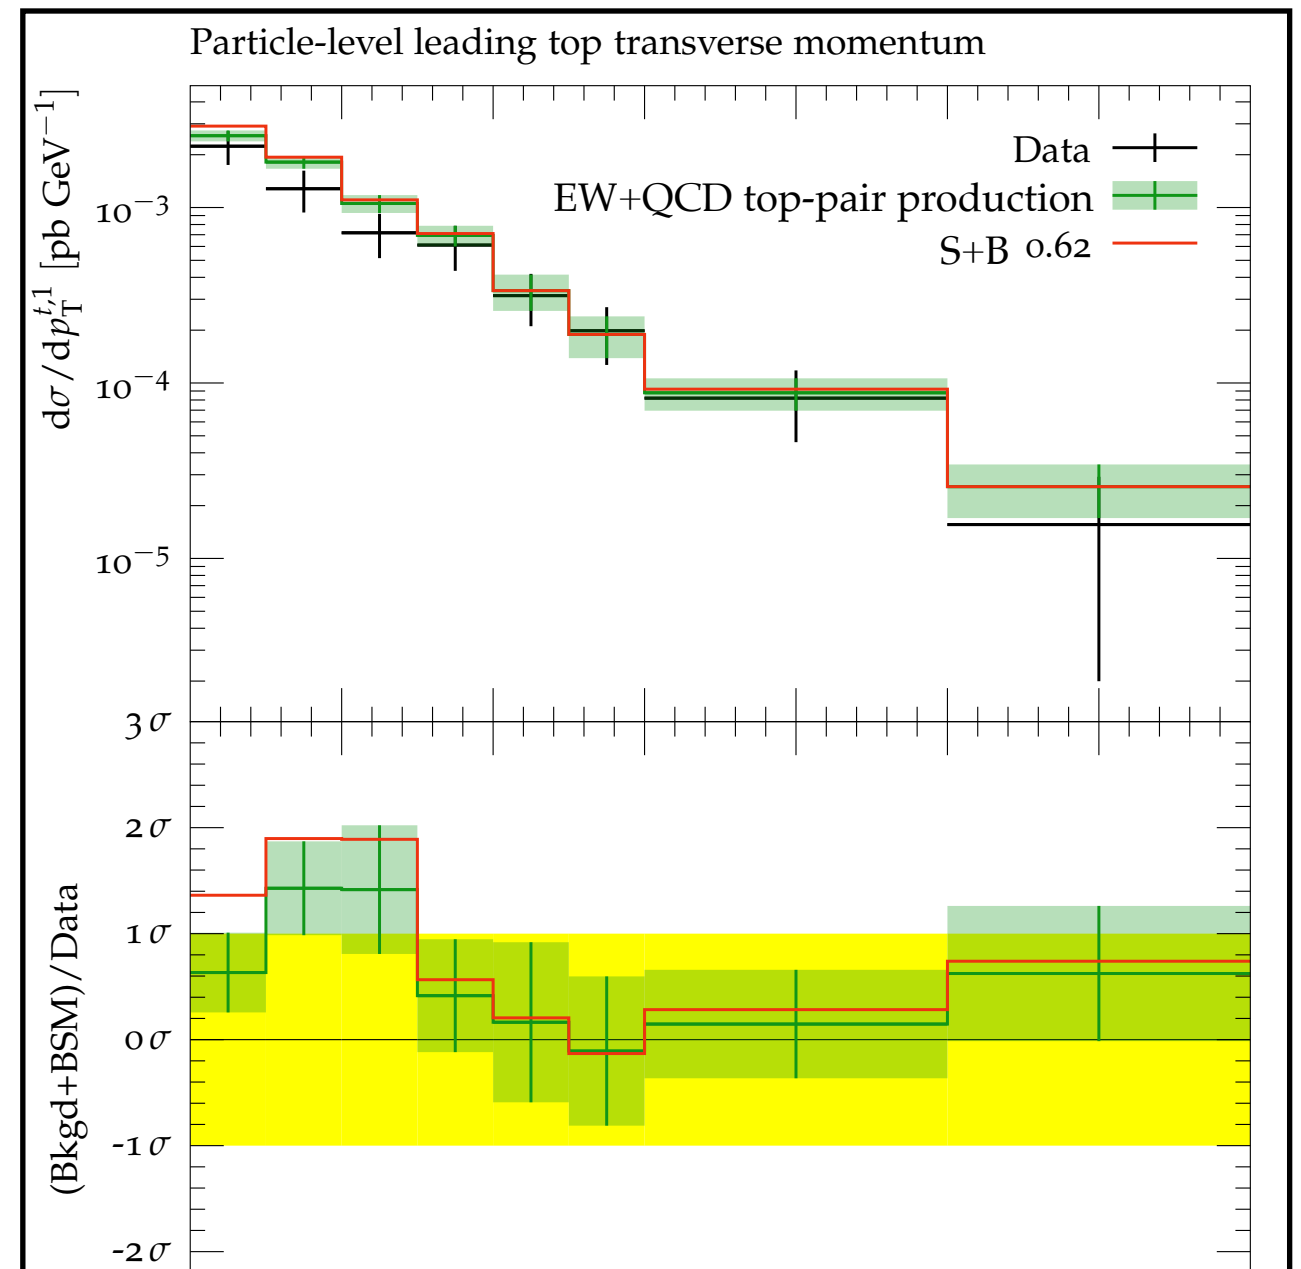

- Precision **SM** calculations with their associated uncertainties define the background
- Superimpose the putative signal
- Check for consistency with the data within uncertainties

The Contur method

- **2nd Approach:**

- Precision **SM** calculations with their associated uncertainties define the background
- Superimpose the putative signal
- Check for consistency with the data within uncertainties

Contur provides the book-keeping and steering machinery to repeat this process over a grid of parameter values

Constraints on theories with extra Z' boson in the top pair final state using *Contur*

M. M. AlTakach, J.M. Butterworth, T. Jezo, M. Klasen, I. Schienbein [[arXiv:21xx.xxxx](#)]

The tool-chain

- The exclusion limits on **BSM** models with extra Z' bosons in the **top** pair final state are obtained as follows:

The tool-chain

- The exclusion limits on **BSM** models with extra **Z'** bosons in the **top** pair final state are obtained as follows:
 - **Contur**: specifies the range for each input parameter

Contur

The tool-chain

- The exclusion limits on **BSM** models with extra **Z'** bosons in the **top** pair final state are obtained as follows:
 - **Contur**: specifies the range for each input parameter
 - **PBZp**: generates **LH** events for processes Involving **Z'** boson for a given set of parameter values

The tool-chain

- The exclusion limits on **BSM** models with extra **Z'** bosons in the **top** pair final state are obtained as follows:
 - **Contur**: specifies the range for each input parameter
 - **PBZp**: generates **LH** events for processes Involving **Z'** boson for a given set of parameter values
 - **Pythia**: showers the **LH** events to obtain **particle-level** events in the **HepMC** format

The tool-chain

- The exclusion limits on **BSM** models with extra **Z'** bosons in the **top** pair final state are obtained as follows:
 - **Contur**: specifies the range for each input parameter
 - **PBZp**: generates **LH** events for processes Involving **Z'** boson for a given set of parameter values
 - **Pythia**: showers the **LH** events to obtain **particle-level** events in the **HepMC** format
 - **Rivet**: imposes fiducial cuts on the produced events

The tool-chain

- The exclusion limits on **BSM** models with extra **Z'** bosons in the **top** pair final state are obtained as follows:

- **Contur**: specifies the range for each input parameter
- **PBZp**: generates **LH** events for processes Involving **Z'** boson for a given set of parameter values
- **Pythia**: showers the **LH** events to obtain **particle-level** events in the **HepMC** format
- **Rivet**: imposes fiducial cuts on the produced events
- **Contur**: Compares the size of any deviation to the background for each set of parameters and gives an exclusion limit. Combines the limits of all the sets into one map

An illustrative example

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- New strong dynamics with $SU(3)_2$ symmetry coupling preferentially to the third generation while the original $SU(3)_1$ gauge group couples only to the 1st and 2nd generation; breaking $SU(3)_1 \times SU(3)_2 \rightarrow SU(3)_c$
- To block the formation of a bottom-quark condensate an additional $U(1)_2$ symmetry with associated Z' is introduced; $U(1)_1 \times U(1)_2 \rightarrow U(1)_Y$
- Z' couples only to 1st and 3rd generation
- The TC model is frequently studied in ATLAS & CMS searches
- Most stringent limits:
 - $M_{Z'} \geq 6.65$ TeV (5.25 TeV, 3.8 TeV) for $\Gamma_{Z'}/M_{Z'} = 30\%$ (10%, 1%) [arXiv:1810.05905v2]

An illustrative example

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters:
 - The mass of Z' : $M_{Z'}$
 - The Ratio of the two $U(1)$ coupling constants: $\cot \Theta_H$

An illustrative example

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters ($M_{Z'}$, $\cot \Theta_H$) \leftrightarrow ($M_{Z'}$, $\Gamma_{Z'}$):
 - The mass of Z' : $M_{Z'}$
 - The Ratio of the two $U(1)$ coupling constants: $\cot \Theta_H$
 - The total decay width of Z' : $\Gamma_{Z'}$

An illustrative example

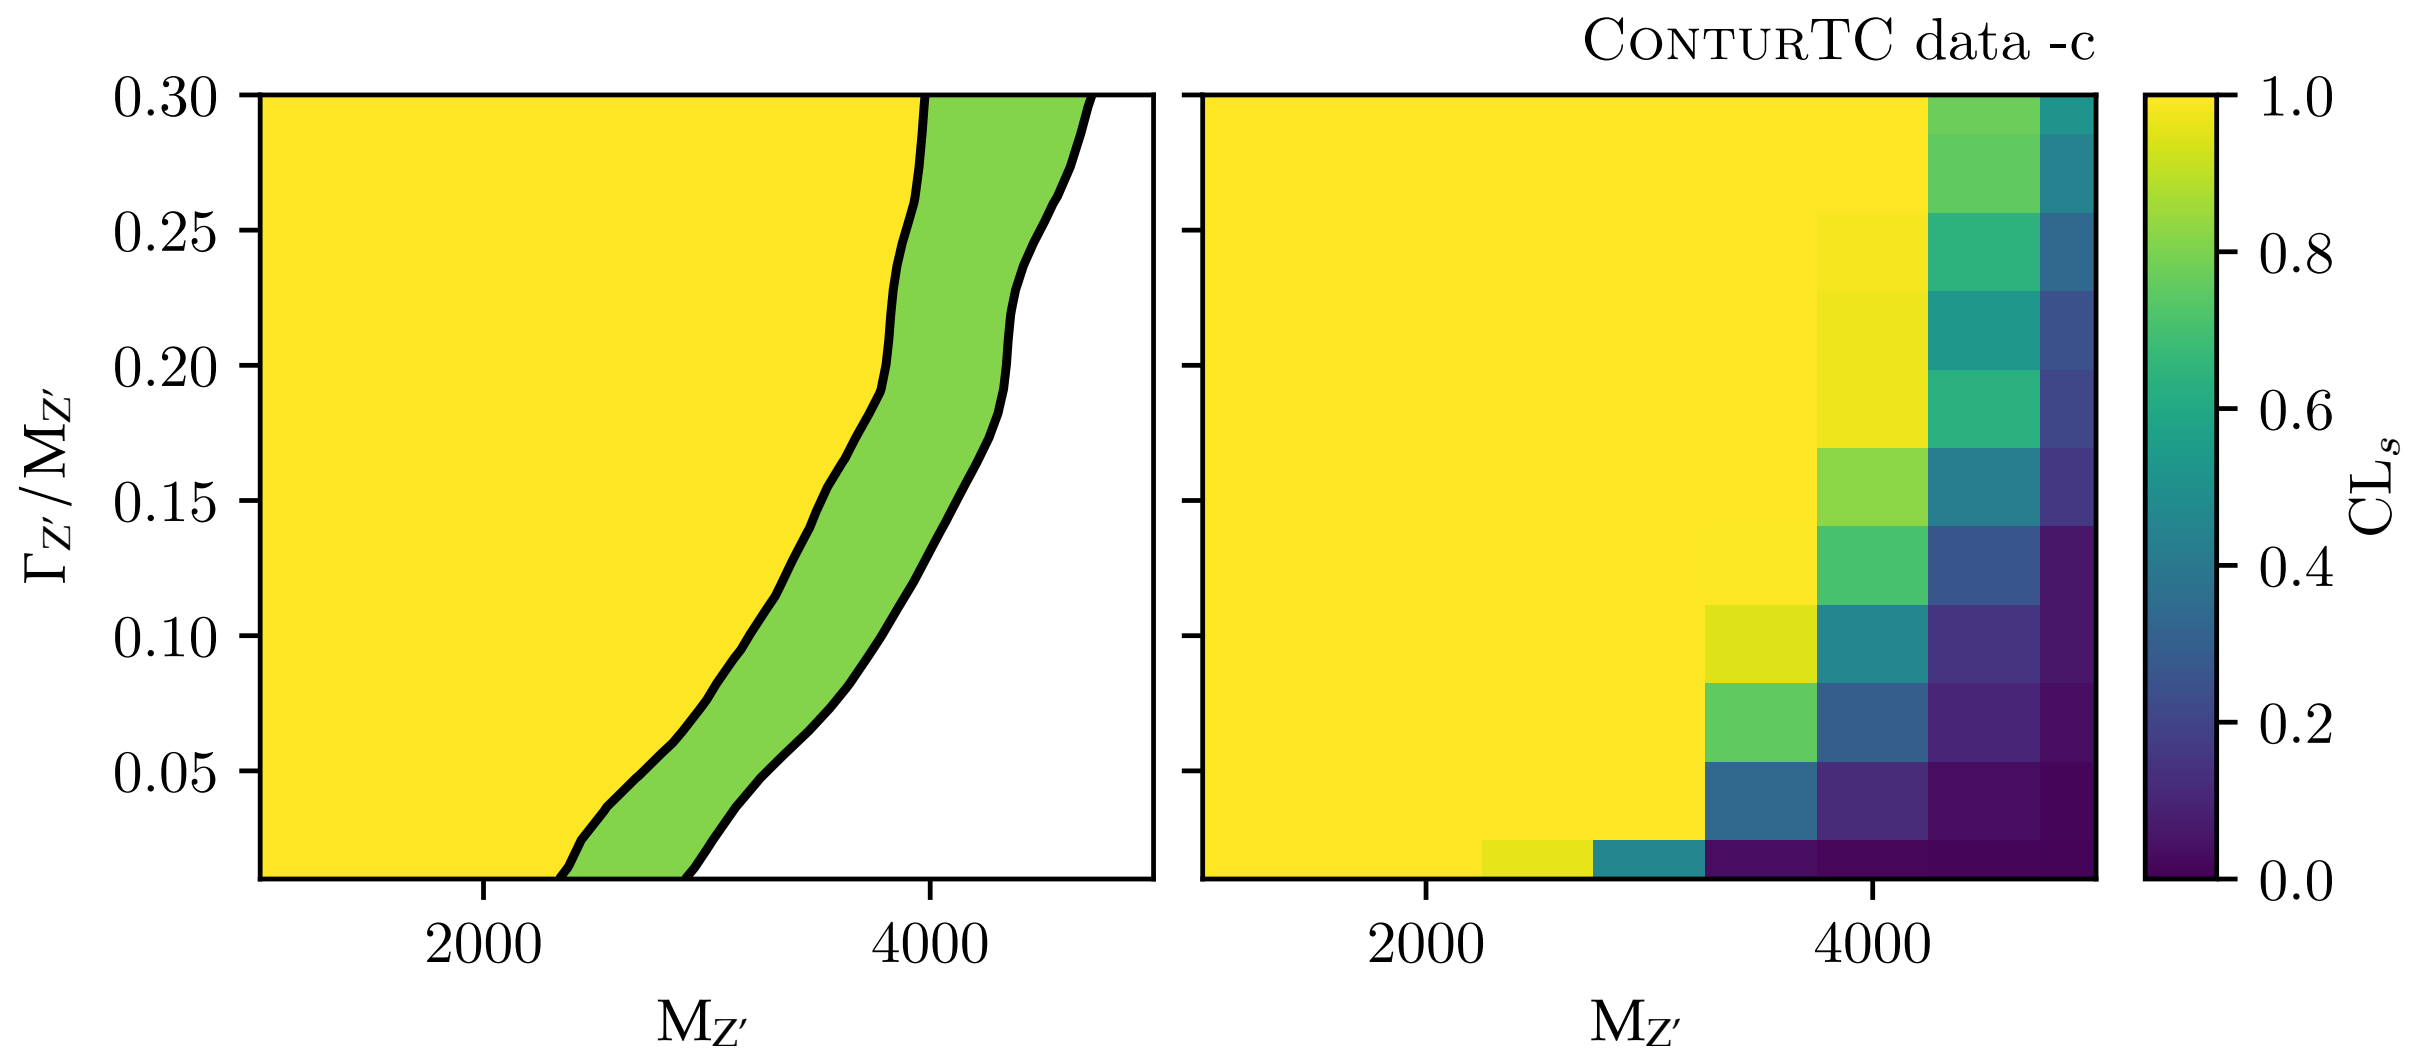

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters:
 - $M_{Z'} = \{1000 \text{ GeV}, \dots, 5000 \text{ GeV}\}$
 - $\Gamma_{Z'}/M_{Z'} = \{1\%, \dots, 30\%\}$

An illustrative example

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters:
 - $M_{Z'} = \{1000 \text{ GeV}, \dots, 5000 \text{ GeV}\}$
 - $\Gamma_{Z'}/M_{Z'} = \{1\%, \dots, 30\%\}$

An illustrative example

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters:

Summary

- Presented a complete re-calculation of **NLO QCD** corrections to **EW top** pair production using **Recola2** in the presence of **Z'** and **W'** bosons:
 - **Z'** and **W'** with **general couplings**
 - **t-channel W** contributions are included
 - **Standard Model** and **new physics interference effects** taken into account
 - Matched to **PS (NLO+PS accuracy)** within the **POWHEG BOX** framework
- Presented a **complete chain of tools** that allows us to obtain **exclusion limits** for **BSM** models with an extra **Z'** boson in the **top** pair channel

QED contribution

- The fact that (c) & (d) have an initial state **C-div.** associated to a **photon** propagator has two consequences:
 - We have to introduce a **photon PDF** inside the proton
 - The corresponding underlying **Born** process must be included in the calculation

- This channel turns out to be **numerically important**

Models

Sequential SM (SSM):

- A toy model where Z' (W') have the same couplings to fermions as the SM Z (W)
- The width of Z' (W') increases proportionally to its mass
- It is a widely used benchmark model in which LHC data are analysed
- Most stringent limits:
 - **Leptonic final states:**
 - $M_{Z'} \geq 5.15$ TeV assuming $\Gamma/M_{Z'} = 3\%$ [CMS-PAS-EXO-19-019]
 - **Hadronic final states:**
 - $M_{Z'} \geq 2.7$ TeV assuming $\Gamma/M_{Z'} = 3\%$ [arXiv:1910.08447]
- Input parameter: $M_{Z'}$ ($M_{W'}$)

Setup & input

- Events in **LHE** format using new-**PBZp** with stable on-shell **top-quark**
- **Generation** cut on the **top** pair invariant mass:
 - $M_{t\bar{t}} \geq 0.75M_{Z'}$
 - Applied at the **Born** phase space level
 - More statistics in the interesting regions
- **PYTHIA 8.2** to decay the **top-quark leptonically** and to shower the events
- **Rivet** to impose the following **acceptance** cuts:
 - $R = 0.5$ (**anti- k_T**), $p_T > 25$ GeV, $|\eta| < 2.5$

Setup & input

- $\sqrt{s} = \{14 \text{ TeV}\}$
- $M_{Z'} = \{2000 \text{ GeV}, \dots, 8000 \text{ GeV}\}$
- $M_{\text{top}} = 172.5 \text{ GeV}$
- **PDF** choice: **NNPDF31_nlo_as_0118_luxqed**
- $\mu_R^2 = \mu_F^2 = s_{\text{hat}}$

Results for Integrated Cross Sections

Contributions to **EW Top-quark** pair production cross section at
LO at **LHC14** vs **$M_{Z'}$**

TC model

Leptophobic Topcolour model (TC) [arXiv:1112.4928]:

- Input parameters:
 - $M_{Z'}$
 - The Ratio of the two $U(1)$ coupling constants: $\cot \Theta_H$
- Total decay-width:

$$\Gamma_{Z'} = \frac{\alpha \cot^2 \theta_H M_{Z'}}{8 \cos^2 \theta_W} \left[\sqrt{1 - \frac{4m_t^2}{M_{Z'}^2}} \left(2 + 4 \frac{m_t^2}{M_{Z'}^2} \right) + 4 \right]$$
